Don't think it can be directly downloaded....I believe you have to order
it from the source listed on the AMSAT web page. But you probably want
to wait until Version 1.5 is out. Otherwise, you may have to pay for it
twice.

Hey Sycho...

When all of the support infrastructure that makes your
electronic goodies fail, will you be able to communicate with
anyone about anything?

We will!!

I can make a small spark-gap transmitter (better yet, three or
four spark gap transmitters) from a busted up transistor radio.
If I happen to have a few hundred feet of wire, I can generate
electricity with my bare feet.

Can you? Can you tear apart an apparently dead battery of cells
to determine which cell(s) is bad, remove it, and get useable
current from the rest?

Can you generate a distress signal using only your wits and and
a pile of electronic "junk"?

You don't understand the art of amateur radio.

See you on the island! Going rate: Two quarts of water (de-
salinated only) for 2 minutes on the transmitter.

JB

So will CBers. Besides, the people who have the money invested in the
communications infrastructure won't let things stay down for any extended
period of time.

A private chat room with a ham, now that is exciting.
More exciting than talking to the finast woman in the world.

Please visit my World Wide Web Site, you have never seen a page like it. You
will see:

1. Access to oldies mp3 (albeit on an irregular basis)
2. Really interesting answering machine messages
3. A blond naked chic being held by a female ham!.
4. A guide to the best ham pages ever.
5. Hear Ted Kennedy really screw up in front of Clinton
6. Actually sounds of Bill Clinton "after the lov'in".
7. The writings of me and others on ham radio, hear a typical ham contact.
8. The warm side of K1OIK, hear me speak, see me with famous people.
9. An amazing card game that will shock others
10. Pictures of me and my family.
11. Did common German's enable the holocaust?
12. See now the future of ham radio.
13. How to pass the A+ Certification

Burt Fisher
A Plus Certified Teacher of video, broadcasting and electronics
Amateur call South Dennis, Ma. (Cape Cod)

Connect two clip leads to the batteries. Connect one clip lead to a
rusty file. Drag the other clip lead over the file in Morse Code
sequence. <grin>

I've heard C.W. transmitters that sounded like they were built that way.

Cecil....

I'm betting you are a good guy, but I'm also betting that you are baiting me.

If you are an EE, and you don't know how to build a spark-gap transmitter, then I'm sure that I'm not the one you need to be talking to.

See my response to Glen for starters.

Also, remember that in my first post in this topic, and in those posts following the first, I am communicating with someone who relies on the understanding and promise of performance from others rather than on his own technical 'understanding of the concepts' himself.

Again, this is not a question of legality or of polite, logical discuurse. To me, it is a matter of practicality....there are those who "CAN" when it comes to radio wave communication, and those who "CAN'T".

Those who "CAN" are those who understand the art of amateur radio (or, those who understand the technical essence of radio telecommunications in general, for those who like to split hairs), and those who "CAN'T", meaning those who rely on others to provide them communication services, and who have NO idea of how to arrange the same service for themselves should their enablers fail at the task of serving them.

In a nutshell, I am considering those who "talk out of their butts" against those who have the technical saavy to be "CAN DO" operators.

Discussions along any lines other than these are based on a failure to understand my point of departure, and a failure to understand the difference between a technically saavy ham and the qualifications of the intended recipient of my first post.

Basically, discussions along any other lines than these betrays that the dissenting poster didn't understand the difference between the original poster's comments and my response to those comments.

Regards!

JB

Plan on using a linear with the FT726. It only puts out 10 watts on
both VHF and UHF. I used one for several years, and it was a good
little rig for the money. The biggest drawback was lack of inverse
linear tracking however.

That same "circuit" was in one of Radio Shack's Engineering Notebook
series (a collection of booklets for electronics beginners).

Let's not forget that spark (Class B emission) wasn't banned until
1 January 1966 as per the 1959 Geneva International Radio Conference.

I suppose you could use the wire from the ferrite loop antenna to
make a step-up transformer; you'll need to construct an "interrupter"
and place it in series with the primary so the battery voltage is
pulsed. Use some metal from the radio's frame to make two opposing
electrodes -- they're in series with the transformer's secondary.
It can be made frequency-agile by making a tuning circuit from the
the 365 pF variable cap and one or more of the inductors. It will
be as broad as a barn door -- some stages of filtering can be
added using components from the transistor radio.

A "clean" spark transmitter was discussed in detail on the GlowBugs
email list some time ago.

Got to go watch for the NASA satellite observatory's re-entry --
it's supposed to crash into the Pacific within the next half-hour;
six tons of it is supposed to survive the re-entry.

Of course, 10 Watts is enough to put out the EIRP that Amsat recommends
before launching a satellite. In practice one needs 10 dB more than that,
"because everyone has it"...

Situation will probably be the same on Phase 3D.

Sure it does, Cecil. You pull out the ferrite antenna
in the radio and unwrap the windings. Use it for the
file scrape thing.

Glen...Do you recommend Farnsworth or straight
timing for good file work...;-)

Hi Pat

At home I have an Arrow handheld beam and an ADI HT204 (similar to 600)
In the car I have a Larsen dual band mag mount I believe its a NMO270 or
similar model number, on the trunk. When mobile I have 5 pairs of
frequencies to compensate for doppler. Don't forget that by the time I
get it on northbound trips I am usually mostly talking to Canadians an
northern US so it is starting to get quieter. I also try to do my mobile
work during the middle of the morning as I am able to get out of the
office and drive to other work sites. I plan my trips to coincide with
passes.

I get up early Saturdays and go stand on a nearby hill with the Arrow
for the low angle passes. I got Iceland one day and England the next
week.
I occasionally hear French stations.

Hope to talk again soon on the birds.

Come on Cecil! You're not cutting me any slack. I could go get
my "tune in the world with Ham radio" primer to find the answer,
but instead I'll just say that I can cause an electromagnetic
disturbance just by walking accross my floor and grounding out
on a doorknob. If I find a way to do it on demand by recharging
my source potential quickly, then by touching two conductors
together to effect the discharge, then I am even more efficient.

Remember the (primary)recipient of my original post, and you
will see what I was getting at (I think you already see it and
now you want to twist me a little bit).

Remember that in my first response post, I didn't mention
radiating efficiency/ ERP at all!

In that post I was also careful to mention that I could find a
way to generate the power (sorry, EMF potential) if I had only
enough wire (and I could, and you could too, so don't ask me
how!) A few capacitors in series from the transistor radio to
enhance the discharge, and a switch, boy, I'd have the best
highly enhanced S.G. transmitter on the block. That's all!

_ _··· ···_ _

JB

p.s. I was thinking of using my own human energy to turn the
speaker magnet inside a coil. Can you tell me that , in theory,
it wouldn't work?

How are you going to do that with capacitors rated for
ten volts maximum? I'm giving you a hard time about making
a spark-gap transmitter out of a transistor radio which is
manufactured with low voltage parts. If you had said instead
that you could make one out of wire, a file, and a car battery,
I would not have said anything.

Similar software is part of all Linux distributions ("Soundmodem
support"). It supports, among other things, 9600 baud FSK and 1200
baud AFSK (terrestrial packet).

Because old AO10, in it's crippled condition, doesn't do very well with
50 watts ERP. (10 watt radio, 3 db feedline loss to antenna, 10 db
antenna). That's the bird he wants to work, and he needs about 100
watts ERP to adequately get into it. Even that much ERP doesn't
completely compensate for the AO10 tumbling nulls that occur. But any
```

more than 100 watts is not reasonable, and would eat up most of the transponder's power. Hope that explains my position.

Cecil...

I know you are a very smart guy. I stumbled accross your comments in the "speed of light exceeded" topic, and now I am sure that you are having a good chuckle at my expense.

That's OK!

But remember that in my original post about the transistor radio parts being used to create a spark gap transmitter, I didn't mention efficiency, ERP, or "final stage" power of any spark-gap transmitter.

I was trying to show the fellow who bad-mouthed amateur radio that it is better to understand for one's self rather than depend on others who understand for us. It is especially curious that someone should bad-mouth the very people who are to be credited with many of the advances that give the bad-mouther a comfortable, cushy communications lifestyle.

And everything that I proposed was in line with current EMF radiation theory (granted, in a very simple way).

Twist me a little more!! But now I think I am sure that you knew where I was coming from, right from the start!

Any time electrons flow in unison there is some electronic
disturbance that results. Anything that moves in an electric field
generates a magnetic field and any conductor that moves in a magnetic
field generates an electric current. Any field may be a disturbance to
any other fields anywhere....even in left field... even in miscelaneous.
When the Ham population signifiently increases or decreases it can
be a reason to post about it in rec.radio.amateur.misc. It is well
withing the field of such a category since it signifies a probable
disturbance to the total basis and purpose of amateur radio...just as
much as a gigantic solar flare. There sure will be some miscellaneous
effects involved!
People who believe that electricity flows from + to - use the right
hand rule. People who believe that electricity flows from - to + use
the left hand rule. Let me put another twist on the subject. People
who believe that Ham Radio is not a technical hobby are trying to make
up their own dumbed down rules which can cause such a disturbance that
hams will flow away from the hobby and non-hams will be so repelled as
to never consider becoming hams.
This is my unified field theory. I'm just a ham. I don't promote any
hand rules but sometimes I think we need to signal that uses some
finger rules. I dunno if they will only include thumbs up. Surely
some concepts recently enacted call for other miscelaneous finger
gestures.

1480. where is SO-35?

Newsgroup: rec.radio.amateur.space
Date: 2000-06-08 00:00:00 UTC
From: Agent I <I@theoffice.net>
Message-ID: <8hofic$2ov$1@grandprime.binc.net>
Source record: 9214

I havn't heard SO-35 in a few days. I was outside for a pass but heard nothing. I saw it key up every 7 seconds or so. at least i think it was so-35 because i was tracking it but all i got was a full meter, no voices.

The website said they had voice communications thoes days.

Radio Meteor Observation Bulletin No. 82 June 2000

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Paseo Bonanova, 8 Barcelona (02 07'E, 41 24' N)
Frequency: 48.24715 MHz.
Transmitter Location: Biedenkopf C2 TV, Video Frequency 48.250 MHz,
ERP 100 kW, Azimuth 90 +/-65
Antenna: 6-element Yagi 617-6B, 14 dBd gain.
astronomical azimuth 215 deg (=NE), elevation 0 deg.
Antenna: Six element Yagi 617-6B, 14 dBi gain, horizontal polariz.
Azimuth 200 deg (NE), elevation 20 deg
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (500 Hz) and fed into the PC in real time.
Data sampling system: own written software "MSD" with sound card.

```

Notes:
. with the Meteor software detection (MSD) I can determine now if there is F.A.I. or sporadic-E opening propagation.
MSD is now translated into English but the explanations are in Spanish, very soon they will be in English too.
. ? probably affected by sporadic-E

Enric Fraile Algeciras

Observer: Michael Boschat
Location: Halifax, Canada (63 36'W, 44 39'N, 58 meters above sea level)
Listening Frequency: 83.24 MHz

Receiver: Icom R-10
Antenna : resonant dipole
Antenna Direction: Horizontally polarized with lobes in E-W plane, elev 0 deg
Filter : high-Q (Q at least 300) bandpass filter between antenna & receiver.
Listening Mode: CW
Recording method: listening by ear

May 2000

. - = no observations made.
. * = interference

Mike Boschat

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi (x form), 4 elements, astronomical azimuth 270 deg
(= E), elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal

generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB.
SWR of antenna alone at 66.5 MHz: 1.4/1 (good to very good),
measured with MFJ/259P SWR analyzer (HF-VHF 1.8 MHz to 170 MHz)
on Sep 28, 1998.
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the Ghent University format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

Notes:
. thunderstorms on May 6-11, 16-17.
. ? probably affected by sporadic-E, tropo, direct reception.
. * warning for relative high number of long duration reflections,
an indication for potential stream activity.
. local time = UT + 2 hours

Maurice De Meyere

--------------------------------------------------------------------------
Location: Astronomical Observatory, Ghent University, Belgium
(ED50 coordinates: 3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
narrow band resonance lambda/4 antenna filter
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
```

ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Notes:
. about the April observations: the big Aurora of April 6-7 is NOT noticeable
in our forward scatter observations.
. activity increase between May 5 and 9 (eta Aquarids).
. lots of interference (Es) in the second half of the month.

Pierre De Groote

Observer: H. W. Kelsey
Location: Conway, Arkansas USA (92 25' W, 35 02' N)
Frequency: 89.5 MHz
Transmitter: Tulsa, OK & Salina, KS
Receiver: Sangean 803A
Antenna: Yagi Heading: SNW
Observing Method: Recorded on Audio Tape

Underdense/Overdense Scale:
Overdense: 1.0 second or more duration
Underdense: less than 1.0 second duration

Each observed hour is 60 minutes, exactly.

Will Kelsey

Observer: Werfried Kuneth
Location: Ferndorf, Austria (13 37' E, 46 45' N)
Antenna: 2 element Yagi, direction southeast, no elevation at 1 m height.
Receiver: IC-706 at 53.76065 MHz, CW-R mode, 500 Hz CW filter, fast AGC.
Transmitters: 1) 30 kW TV video carrier from Bari, Italy, distance 700 km, direction south and 2) a 30 kW TV video carrier from Sicilia, Italy, distance 900 km, south. The total echo power of both transmitters is processed into same 40 Hz virtual receiver channel.
Observing method: automatic setup using FFTDSP42t software by AF9Y to record the audio signal. 20 channels of 2 Hz width are used for meteor identification, with manual interference rejection.
Sampling interval: one 4096 point FFT every 0.5 seconds.

The monthly results showing the total reflective time are now also available at http://www.qsl.net/oe8fnk this includes now also Es, FAI and radio fireball statistics.

The meteor counts below are corrected for a full hour observing time. If the recording duration is 20-40 minutes, a dot is shown after the value, to show the reduced accuracy. Results for less than 20 min. observing time are excluded.

Counts of reflections longer than 6.5 seconds,
assumed to be overdense

Notes:
-: no observations
*: affected by enhanced ionospheric or tropospheric propagation

Ton Schoenmaker

Observer: Dave Swan
Location: Christchurch UK (50.47 N 1.44 W)
Receiver: Pro 2006 (modified to give a carrier detected output
for Chessell 301 pen recorder). Sensitivity NFM: 0.5uV
(S+N)/N = 20dB Dev: 3 kHz at 1kHz BW 9 kHz Calibrated: 1/05/00
Antenna: 4 element Yagi broadband design for 50-70 MHz Gain 9.2dBi.
Azimuth 95 deg elevation 8 deg. Two 3 stage constant K filters
fitted after the antenna, (High and Low pass) to reduce
out of band interference and intermodulation products
causing spurious meteor counts.
Frequency: 66.62 MHz
Transmitter: Budapest 100 kW 24 hrs
Computer: Olivetti 386 Notebook with Meteor v 4.0 software

Observer: Garfield Tsao (BM2EQB)
Location: LonTan Observatory
LonTan, TauYan, Taiwan R.O.C. (121 14'37" E, 24 52'54" N by GPS)
Frequency: 50.0169 MHz USB mode 3 kHz width.
Antenna: Comet made 50 MHz Yagi HB 4 element (gain 10.3 dBi)
astronomical azimuth 225 deg (=NE), elevation 7 deg.
Transmitter: MIYAZAKI University Japan, USB mode, 50 W (24 hours),
distance about 1125 km from Lon Tan.
Receiver: Icon PCR-1000 computer controlled all band receiver
Sensitivity: 0.25 uV for 10 dB S/N for USB mode
Observing method: the beacon 880 Hz voice signal (by FFTDSP) is
received by a low frequency filter (880 Hz)and fed into
the D/A converter and computer in real time.
Data sampling system: using an 8 bits A/D card to PC/AT and Qbasic program
with 1/8 second sampling interval to store the> 1.0 s reflections.

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

Hi Carl

Sunsat has not had any voice passes this week.
Their web now says no amateur passes since June 8, digital or voice.
I check the site every day as they are changing the schedule quite often
lately. The GPS and Photo experiments etc. take precedence over the
amateur passes.

1489. Maryland Hamfest - 18 June

Newsgroup: rec.radio.amateur.space
Date: 2000-06-10 00:00:00 UTC
From: windbrkr@erols.com
Message-ID: <MPG.13ac3b45bae4ef4098975f@news.erols.com>
Source record: 9223

The Frederick Amateur Radio Club (FARC) presents the annual
Father's Day Hamfest on Sunday, June 18, 2000
from 8:00am to 3:00pm, rain or shine.
(Access for tailgaters opens at 6:00am)

It's at the Frederick County Fairgrounds on East Patrick Street in
historic Frederick, Maryland. Easy access from I-70, I-270, US-15, US-
40, etc. Plenty of parking.

Talk-in on the 147.060(+) MADRA repeater.

We'll have Radios, Electronics, Computers, Acres of Tailgating,
Indoor Commercial Vendors, VE Testing and more.

AMSAT rep. will be there.

Good food and refreshments available.

On the web go to http://www.qsl.net/k3erm/ for more info and a map.

General admission is a $5.00 donation.
Tailgating spaces are $5.00 each + general admission
Indoor tables are $10.00 each before June 10th, $15.00 after.

One of the largest and most popular hamfests in the
Baltimore/Washington metro area. Don't miss it!

Questions? E-mail k3erm@qsl.net or direct to me.

Thanks & 73,
Bob K9CMR

...and don't tell me to read the FAQ! (grin)

I'm brand spanking new to Satellite - but I have been on the air the past two weekends on AO27 and UO14 - and I'm having a lot of fun.

I don't have any 9600 bps equipment to work the pacsats, but I do have all I need to do the voice birds.

Can someone email me a list of all the birds that are currently operational in the US, and what frequencies you key into WiSP for rig control? I'm especially interested in those SSB birds - since I've already got AO27 and UO 14.

Thanks in advance!

John Reed, N4TII

You're right! We need to substitute Latin for Morse. It too is a practically dead language, practiced only by hobbyists and religious sects, but Latin is far harder to learn than morse, ensuring not only empty spectrum but that everyone you meet is intelligent. We could have two classes, an entry level requiring only the ability to translate Ceasar's Gallic Wars, plus a "general" class for those who can speak and write Latin as proficiently as the Pope. Best of all, beginners would only be allowed to transmit Latin on UHF whilst those who'd demo'd papal proficiency would be allowed to QSO in English on any band! Sound like a plan?

Well stupid, if you didn't know, posting your straight e-mail address on the internet is not a good thing.
You might think its "Manly" and "the right thing to do" but you are subjecting yourself to spam programs
which explains why you keep getting junk mail and subscriptions to porn sites in your e-mail box.
Also, when you make a comment you are allowing people to respond by sending you e-mail.
Most people on the internet, don't deserve the toilet water they consume less deserve my e-mail address, less the right
to give their opinion in my sacred e-mail box.
Don't EVER knock people for not using their real e-mail address or using a handle. You have to as newsgroups are the EQ
of CB not HAM to begin with and you wouldn't give your personal info to CB'ers would you?

Why not? Everybody isn't out to 'get you', and for those few
who really think it's funny to 'subscribe' you to junk mail, etc,
there is a cure. It isn't the most simple thing in the world, but
it can be cured. And usually, 'that' person won't ever bother you
again. I say 'usually' because some people really are that stupid.

It's no wonder that you get hate mail when you start off calling people "stupid." Only cowards or people conducting themselves in a questionable manner have to hide their identity.

A reason ham radio is declining is learning the code, and putting together a station is hard work compared to the ease of buying a computer and joining an internet chat room.

In some respects, the code is like learning a foreign language, and even though there are only a few dozen characters, somepeopleseemtosendcomletesentenceswithoutspacessoifyoumissaletteritmightbehardtofigureoutwheretopickitupagain.
O th er p e op leputp aus es in th e wro ngpl aces,m akingi t toughert o figu reo ut lettersyo umis s e d.

Some people are just better than others at learning languages.

While a no code license exists, it's more limited, and holders of that class of license seem to be looked at as second class citizens by some hams.

I don't think the theory is as much of a deterrent because people who are interested in ham radio are often interested in experimenting. They see a use for it.

Perhaps a compromise could be worked out so people who didn't want to learn the code would need to show greater understanding of theory for a given class of license.

But until the folks who earned their licenses the hard way decide the code is less important than getting more people involved in the hobby, little will change.

It doesn't matter how far you can send a message with 1 watt if nobody is listening.

The post is begging the question. Just because standards change to attract new operators, it does not follow that the new lot of operators are less intelligent and needed the chage in standards to pass the ham tests as they were.

There are many competing forms of communication that appeal to the pool of potential hams. Change may draw some into the hobby who otherwise would not take a second look.

Kindly stop posting this garbage to rec.radio.shortwave. Most of us here are SWL's and don't want to listen to a couple so-called HAM operators get ugly and attack one another (why not do it over the airwaves?).

Have some consideration for someone besides yourselves and *PLEASE* remove rec.radio.shortwave from your headers when replying.

THANK YOU VERY MUCH FOR YOUR CONSIDERATION,

Tim

First let me start off by stating that I am a lowly Technician class radio amateur. I have been licensed for nearly two years and I have enjoyed the bands that I have access to. When I was beginning to become interested in ham radio , I wanted to "work the world" and do some dx. The fcc amateur restructuring has made zero difference in my particular situation. I still need to master 5 wpm to gain access to the hf bands and I still intend to do so. Do I have a problem with increasing difficulty to get more privileges? Yes and No...I do feel that you shouldn't get "something for nothing" and just get a license. However, why is morse code the "chosen mode" for gaining a higher license? There are many modes to operate in amateur radio and simply being proficient at sending and receiving code, doesn't make you a good ham operator. 5 wpm is adequate in my opinion because if you are interested in operating cw and/or qrp , you will get more proficient with cw due to experience. The "die hard" hams out there are so concerned with degradation of the bands...What do they care? All of the of the hams that don't use code, won't be hurting or bothering their precious code allocated portions of the band. The other question that I have...How many of these "die hard" hams are actively involved in their local ham club and community? I can tell you that the club I belong to has about 70 members and most of which are advanced or extra class operators. At the last meeting, I brought up an upcoming event in the community that needs about 6 folks from our group for communications for the event. The same lowly-classed hams like myself were the only ones that were willing to help. All I needed were six out of the 70...SAD!!!!!! The other sad fact is its always the same 3 or 4 active guys in the club that do 90% of the work. I think this is typical of most clubs everywhere and this is where the REAL problem is in ham radio. I guess the higher-classed guys that are code proficient are too busy working cw to help the community, the club, or a new ham...

That is pretty good Old Biker. But it doesn't go far enough, as Latin actually has some utility. I suggest we go with Celtic, as it is MORE like "Morris" code in that it has absolutely NO utility in today's world. Those that passed the Extra examination would be given the privilege to converse in Gaelic on the HF bands. Novices would be given the "opportunity" to converse in Assyrian ONLY on 28.100Mhz, until they built up their dead language skills - those filthy, whining novices!

Yes, it takes a lot of work for them to drag their feet for so long.

BTW, not all of them are so pig-headed. But many of them are - and it is only thru attrition of their numbers, due to advancing age, that change has finally been possible. Up until restructuring, the number of licensed General class hams had been declining at an ever more rapid rate over the last 3 years. But there are STILL a lot of bitter, old coots out there. However, on this newsgroup, the more vocal "Morris" code pundants are mostly only about 45-55 years old, and we should have them to "kick around" for a long time to come!

Good luck with your Amateur activities.

Not me,
Your opinion is worth as much as the name you sign to it. I'm willing to sign my name to what I say, and stand up like a man for what I say. If you were signing your name you might not make rude, lewd, obnoxious, derogatory, specious comments. If I get spam, I report it to the IP, same with porn. And my email address, while valid, is not my working address. I'm not stupid, I have a free Juno email address for newsgroup posts. My postings are items I wouldn't have any problem saying on a radio to another Ham. I wonder, which is more representative of you, the way you talk on your ham rig, or the way you write on the Internet. I try to use manners both places, it's the way I was brought up.
BTW, I've read a lot more trash on the ham newsgroups that I ever heard on CB radio, and I've had one of those since 1970. This looks more like 14.313 than 27.185. And yes, I've given my personal info to Cbers, made some good friends that way.

Mark K5MAR (ex KDW-1411)
And proud of both.

"Not me" <@.> wrote in message

Well stupid, if you didn't know, posting your straight e-mail address on the internet is not a good thing.
You might think its "Manly" and "the right thing to do" but you are subjecting yourself to spam programs
which explains why you keep getting junk mail and subscriptions to porn sites in your e-mail box.
Also, when you make a comment you are allowing people to respond by sending you e-mail.
Most people on the internet, don't deserve the toilet water they consume less deserve my e-mail address, less the right
to give their opinion in my sacred e-mail box.
Don't EVER knock people for not using their real e-mail address or using a handle. You have to as newsgroups are the EQ
of CB not HAM to begin with and you wouldn't give your personal info to CB'ers would you?

Globalstar www.globalstar.com has a 48+spares LEO satellite system that
covers most
of the major populated land regions. It differs from Iridium in that it employes
a "bentpipe"
approach with the switching done on the ground rather than on the satellites.
This means service
won't be available in polar or deep sea areas since there won't be any
"gateways" there.
The gateways have been coming online gradually and now there are about 30
countries with working systems
(www.globalstar.com/en/support/coverage_map.html).
The phones are mostly dual or tri-mode that use local cellular when available.

ICO (www.ico.com) has come out of bankruptcy and will begin launching its
system this year with turn on probably in 2003. However, the sats are being
modified
to enhance data/internet transfer rates, although they still will be useable for
phones. The
basic ICO system (www.ico.com/system/index.htm) involved 12 sats in medium
earth orbit but it looks like Craig McCaw, who bought control of the company,
will
combine it with the proposed Teledesic (www.teledesic.com)LEO system. The
current
design for Teledesic includes over 288 sats but this probably will be
drastically reduced.

Inmarsat (www.inmarsat.com) has offered mobile phones (in briefcase sized
systems)
for several years using GEO satellites. They are now starting to emphasize their
internet
systems. Inmarsat is a partner with ICO and so will switch to that system when
its available.

Skybridge (www.skybridgesatellite.com) is an Alcatel/Loral consortium that plans
an
80 satellite LEO system but primarily, like Teledesic, intended for broadband
internet

connections. They will begin launches in 2002 with service starting in 2003. It just
got approval at the WRC (www.skyreport.com/skyreport/jun2000/061200.htm#wrc)
for its plan to use the Ku bands that are also used by US DBS systems. They claim to
have a scheme to prevent interference.

Orbcomm (www.orbcomm.net) is a 35+ satellite LEO system that provides data messaging,
email, and other low data rate services. They offer a handheld unit, for example, the Magellan GSC 100,
that can send and receive short email messages. The system is mostly intended, though, for
industrial applications such as ship, train car and truck tracking. Remote gas and electric meter
reading is another market that's expected to develop. (Note that so far Orbcomm has about 250k
ground transceiver systems ordered, mostly for trucks, though they have only installed about 25k due to
various debugging/startup problems. So while it may not be off to a smooth start, indications are that
there is a substantial market for this type of service.)

There are, at least, a couple of other "Little LEO" constellations that have a reasonable
chance of getting launched: Final Analysis (www.finalanalysis.com) with 32+ sats
and LeoOne (www.leo1.com).

As a long time lurker, seldom poeter..
Why not go to the AMSAT website.
Even a "imple" ham satellite is an extremely complex
lttle beast.
Power managment,
Thermal managment
Control systems that are very robust.
Recievers and transmitters that are very reliable.
And let us not foget the "simple" task of getting the
whole package up at least sa 200 miles.
While I suspect that there is some ham somewhere
in the world with the savy, and resoucres to build one,
I suspect there is no ham who can put one in orbit
by himself.
AMSAT is a large gruop of world wide like minded hams
who build satellites of comercial quality for pennies on
the dollar, and it still is not cheap. Or rapid.
A lot of planing, testing, design and redesign go into
to every ham satellite, regardless if AMSAT or the folks
at Surray [sorry about mis-spelling] England build it.
Very few peole have all the many skills required to build a
working bird.
Hope this at leasts opens the door.....

>What about a ham radio
snip
While we are drifting from the purported topics of this news group,
I will offer some very genral observations.
"A ham radio" can be anything from a very simple low power rig, using
crystals as the frequency control method, [Yes I know you can build
VFO but the simplest usable radios especially Transmitters use crustals
to control the frequency] with a parts count of less then 50 components.
While simpler radio exist, my experience has been they are nice to
experiment with, but are not all that usefull to actually communicate with.
To radios that cost thoasands of dollars and have very complex sub assemblies.
I am active in VHF [144MHZ and up] QRP [very low power]
and have a simple 2 band HF radio. Cost next to nothing to build them, did
require some knowledge and time to either locate good desings or desing,
debug and redesign them. I also have a computer controled radio
PCR1000 recevier and even my main SW receiver has a built in microcontroler
to manage the VFOS memories, modes etc. I think the Knewoond R2000 cast
about $500 when new, and while I don;t doubt that some hams build radios
of theat level of complexity, most of do not have the resourcres to design
computer controlled radios, mixing chains etc. Even a simple antiqu best like
the Icom IC-2AT, a very simple, with full synthisis [no crystals to cahnge]
that covers teh 144 to 148 MHZ band would be very dificult to make in a box
4 times its size. It is lots of fun to build stuff, but might be much more
parctical to kimit building to projects that make economic sense.
I limit my consturction to simple things like RF preamps, antennnas, power
suplies, specialized cable that I can no buy. I can purchase good quiltiy
data cable for less than I can get the parts, so unless I need something
wierd [and I do weekly], I buy standard mass produced "things" that will serve
my needs. Thre are many archive sites will loads of diagrams on how to build
nearly anything/everything you could want. I have lost all my older book marks
so I can not offer any usefull suggestions. Just do some searches on radio
diagrams.
None of this was meant to suggest that people are wasting their time building
anything they want. I just built a small dedicated Z80A based beacon.
Pratical, maybe not, but it served my need for a X/Ku band mobile beacon ider.
But I think a lot of new commers might be better off to buy a simple
commercial radio, like a RatShack(SM) scanner. You can hear some satellites
wiht one [NOAA WX birds and some of the LEO hamsats and on at least one
occasion the space shuttle. For a few bucks more the PCR1000 will allow
reception of very good quality WS satellite images. An antenna like the QDH
is not that hard to build and gives great bang for the buck.

1542. Inline preamp for Arrow handheld antenna

Newsgroup: rec.radio.amateur.space
Date: 2000-06-14 00:00:00 UTC
From: kf6tbn@my-deja.com
Message-ID: <8i8jf5$9lg$1@nnrp1.deja.com>
Source record: 9176

I've been trying to work AO-27 and UO-14 with the Arrow and an FT-51R.
I find that I can hear UO-14 great, even full quieting under good
conditions, but AO-27 is always noisy and frequently almost unreadable.

I'm wondering if a preamp would help, and I'm hoping somebody makes a
small one that will fit inline, at the 430 connection on the Arrow.

Any suggestions are appreciated.

Thanks,
Bob Armstrong

Outnumbered by the idiots!

Despite which, (given the title of this thread) Amateur
Radio still survives and will continue to survive.

Low Earth Orbit.

Take a look at my website. www.mailbag.com/users/meteu/kb9ung.html

I have a ham radio satellite page there that has some good info. I just rebuilt part of it and am working on the rest still.

You are absolutely correct or at least that is what most of the hams on usenet indirectly believe. They think the ARRL proposal and the FCC ruling were good for amateur radio. (Dumb down the standards! A service full of retard hams is better than a service full of smart ones.)

If anyone disagrees, then you should be able to support the following:

Step 1: No more automatic renewals. Individuals must retest and pass all elements required for their license class.

Step 2: The passing score for written exams should be 90%.

Step 3: Two code elements, 13 wpm for General and 20 wpm for extra.

Step 4: No-code license should be one year non-renewable.

There's a grain of a good idea in there. Retest every ham
every ten years and increase the passing grade requirement
one percentage point for every year he has been a ham until
he is required to score 100% after being a ham for 30 years.

The moral of the amateur radio "licensed" operators is at it's lowest in three decades.

If your looking for the FCC to eliminate amateur radio licensing forget it. The hams across this great nation and world will not allow it to happen. Why don't just sit back, study the thoery, code and take the test like the rest of us.

I think the correct way to state that is:

"A service full of hams or no new hams at all"

Let's get real here. I got my ticket primarily for the public-service aspect of ham radio. I'm not interested in cw nor am I interested in contesting. The concept of spending umpteen thousands of dollars and countless hours just to get a signal report from someone in Zimbabwe is ridiculous as far as I'm concerned. I am *NOT* knocking those persuits for those who do like them; it's just not for me.

That said, I hold a no-code tech license. If it were necessary for me to learn 5wpm cw to get _any_ ham ticket, I would not have bothered, and instead I would probably have looked at REACT. I'm sure some of the old farts reading this are probably thinking that would be better, however let's remember that first and foremost, public service is what ham radio is about and it's why the FCC doesn't just go and grab all the bands for commercial purposes.

Ham radio has to keep up with the times. During it's heyday, if one wanted to be involved with electronics and communicate over vast distances, ham radio was the only way to go. Contacting someone in Zimbabwe was considered a "big deal" then. Now, with cheap long distance and the Internet, the public is no longer impressed, and may, in fact, think that anyone who would go to such trouble instead of just picking up a phone is foolish.

If you insist on making the entrance and renewal requirements of ham radio more difficult, there will soon be no new hams. All you have to do is look at the average age of the ham radio population to see that is exactly what's happening. It may already be too late to change that.

I won't settle for anything less than the NCEE Electrical Engineer P.E.
exam for the Extra, with at least 30 wpm of code. (More is better isn't
it?) And, unlike professional engineer state licensing, LET'S MAKE EM
RETAKE EVERY 10 YEARS TO KEEP THEIR LICENSE. And, oh yeah, the State
P.E. passing grade is a paltry 75%, curved. Let's make sure we only get
the best of the best, and set passing at 100%.

In only a decade, the ham population of the U.S. should be maybe 2, or
3. Now, if they just had someone to talk to. I'm sure there's a few
JY1 types out there who didn't test at all, but just declared themselves

a ham.

It sounds tough, but one must prove their excellence to access a public airwave, shouldn't they? Just like broadcasters? :)

Thomas Talley <talleyt@msn.com> wrote:
>Boeing is about to launch a Delta III with just BALLAST!!!

Of course you need to find someone who has confidence in the Delta III, and would trust his satellite on the third launch of it, after launch 1 and 2 both failed.

And then, Boeing would have to be interested in launching that satellite instead of their ballast. So that satellite would have to bring them the same amount of data about the performance of their launcher, at the same risk to them. And it should not cost them much more to cover the integration of that satellite, and the change in orbit required for it.

Remember even Ariane 5 has flown with ballast when Phase 3D was "available" as a possible launch candidate. It is not as simple as showing up on the doorstep with a box of hardware and the "please launch this instead of your block of steel" question...

Both ham radio and CB suffer from this phenomenon, but not to the
degree you imply.

Our club provides assistance to the Red Cross, various athletic
events, and on a continuing basis through the county emergency
operations center and Skywarn.

Most people don't get into ham radio as a way to do public service.
It's usually the other way around. You get a licence, and then
discover the opportunities to serve that utilize your abilities as a
ham, beyond what a non-ham can provide. In my case, I feel that
since the public is loaning us these bands to operate on, we should
perform some public service in return. We certainly see enough
instances where normal communications channels aren't suficient in an
emergency..

During the Y2k rollover, we were on standby to provide communications
in case the county's 800 system went down.
Motorola couldn't provide any assurances that it would remain
operational, but our radios simply don't care about the date. As it
happened, nothing happened. I didn't expect anything to happen
either, but we were there.

Last week I had a downburst near where I was storm spotting. It took
out the phone lines, and the cell system lost eight towers from the
same storm. The area happens to be on the fringe of the county's 800
MHz system, so the only thing that was working, in terms of getting
help and reporting what was going on, was our 2 meter repeater.

A month ago, we had a severe hailstorm, and our advance warnings
probably saved lives. With several square miles covered with

baseball sized hail, we had no injuries, and only unavoidable property damage.

Yes, my car flies Skywarn signage, and flashing lights. At the request of the county EOC director.

I also carry an ID that extends his authority through me, so I can get past police roadblocks in an emergency, and be on the street during snow emergencies. We routinely carry patients to the hospital for dialysis and deliver urgently needed prescriptions during heavy snowstorms. This could be done by ambulances, but we free them up to make more serious runs, that we can't handle.

We are very aware of the "cop wannabee" problem, and if we ever see it happening, we will step on it fast.

As for literate, I'll let my movers answer that one. I had enough books in my last move to double the packing time from their original estimate.

> If they were **really** interested in "Public service", how about
> volunteering at the library, local hospital, animal shelter or soup
> kitchen? Oh, no one to "boss around" there. Couldn't "look cool"
> with that 8 pound brick on your belt. Sorry, should have known.

Not interested in "bossing anyone around", and I don't "look cool" with or without a radio.

When I lived in rural california, within a month of moving into town, I had signed up for the fire department. This is an unpaid, totally uncompensated position, that requires many hours of training, and many many interruptions at any hour of the day or night. Most of our calls were called out to freeway accidents, so it wasn't even helping anyone we knew, or were ever likely to see again. I did take a certain amount of pride in being a fireman, who wouldn't? The interesting thing is, I was just as happy to be in doing equipment checks or cleaning hoses as pulling people out of wrecked cars, or putting out fires. It also taught me a lot about myself, like that I make a better follower than a leader. Funny thing is, when I realized that, I expected to be disappointed somehow, but I wasn't. I'm prefectly happy not to be in charge.

When I first got my licence, I lived in Anaheim Ca, and belonged to a group of hams who were also amateur seismologists. (comes with the territory, literally) Don't laugh, when a quake occurred, the news media and city officials went to us first to find out what was happening, then to Cal tech for the official (but somewhat delayed) story. The watershed event for this was in the simi valley quake, we had the center of damage pegged properly, but epicenter determinations from caltech sent all the emergency equipment into an area where there was very little damage. This is where the city governments learned the difference between the epicenter and the hypocenter, and that seismometers can't find the hypocenter in any

useful sense. With our many observers all over the area, we could pin the damage center very quickly, usually in just a couple of minutes. It was very similar in effect to Skywarn here in the midwest. The NWS radars are fine, but they don't cover as well as you think, they have a six minute delay, and they can't tell you what's happening nearly as well as a trained observer at the site.

Am I a typical ham? I don't know. I guess I'd like to think so.

What public service have you done lately?

I am assuming that you are the USA.
If so then you CB is almost certainly an AM/SSB radio.
It opereates areound 27MHz. WX satellites are FM.
While I am sure that someone could retune/redesign/rebuild
an AM/SSB SC to receive 137MHZ, as Bob Dylan said "It ai'nt
me babe".
You might want to lurk in the rec.radio.scanner use group for a while.
There are some very good [and very bad] posts there.
Bob Parnes rotuinly runs a "intro to scanning" piece that is
very informative.
I would also suggest that you might want to study for a ham license.
To get one you need to learn things that will help explain why what you
want to do is better done other ways. this is not meant as a flame or put
down, but I am afraid trying to explain "how to" in this limited
forem is only going to confuse and frustate you.
Radio is a lot of fun, but to go very far you have to learn some odd
and bizare technical "Stuff". IT is well worth the effort and like I
said, radio is FUN.
Good luck.

With an address of "HotPrsut" one would assume that you're referring to yourself. However, since you chose to address your sweeping generalization to my posting, I'll reply to it.

It just so happens that the fire chief of the community for which I provide communications assistance, was involved in hurricane Andrew. He saw the value of having ham radio assistance during emergencies and has had the participation of amateur radio volunteers written into the village's disaster plan. The local police and fire dept. personnel welcome our assistance and we have access to their frequencies as well as certain facilities that are not open to the public.

There are 8 of us in the group, and none fit your generalization. Many are professionals, and some, like myself, own our own companies.

In the future, you may want to refrain from describing yourself when you really mean to slam someone else.

That doesn't say much for your company, Mark. What if prospective
customers do an internet search on you and see:

>Good. Get it reeeal hot, and then, shove it in your eye.

I sure wouldn't care to do business with a company president who
makes such hate-filled remarks, and would make sure others I know
avoid whatever it is you and your company does, if at all possible.

That's fine if you don't mind being leashed. You're helplessly dependent upon untold billions of dollars of computer equipment belonging to thousands of corporation, interconnected by millions of miles of cable, staffed by thousands of workers putting in tens of thousands of man-hours per day to keep that incredibly complex system running.

Hams, on the other hand, have no such dependence. It's the *only* communications medium in which any two operators anywhere in the world can communicate without using government or commercial communication services. Those same two operators don't even need to purchase commercially-built radios -- they can build their equipment themselves.

BTW, the prediction that ham radio is dying is older than you are: In "...1922 many radio magazines which had catered to the transmitting amateur swung away from him, one even so far as to run an editorial ... prophesying the end of amateur radio." (From Fifty Years of ARRL.)

Interesting that so many of the newer Hams continue to tout the "Public service" aspect. My experience with this group is that they are generally fat, lazy, often semi-literate, "cop wannabes". Most have never been in any position of authority nor exercise any sort of control over their lives. This frustrates them. They see "Public service" as a chance to carry a radio on their belt and be "important".

While the professional officers always warn these folks to leave the policing to them, invariably, these cop-wannabes take matters into their own hands, ultimately botching the situation and giving Amateur Radio yet another "black eye".

If they were **really** interested in "Public service", how about volunteering at the library, local hospital, animal shelter or soup kitchen? Oh, no one to "boss around" there. Couldn't "look cool" with that 8 pound brick on your belt. Sorry, should have known.

Or, so it seems to me.

Ferrari-550@worldnet.att.net says...
>
>I do have a weather radio with 3 ch. would that work I don't think it would
>I would need something bigger.

IF you are really determined, you could probably
retune it from the current 162MHz range down to
137MHz. But even if it had enough sensitivity,or
if you added a good antenna, that radio was designed
for a voice, narrow band FM signal. You could
certainly hear a wx sat, or if you tune it to
the 145MHz range you could hear some of the low
earth orbiting ham sats. But it would be a real
nightmare.
A real scanner is a much better starting point.
With one, you can at least be certain of what
frequency you are tuned to and with out that
it is a gamble. My first WX Sat radio was an
old McMArtin "Muzak" receiver. But it was not
worht all the time and effort it took.
Had I gone out and collected soda cans from
the raodside, and sold them for scrap,
at pennies on the pound, I would have be time
ahead. OF course it was very educational!...
Good luck

Still haven't gotten an HF receiver yet?

Let's have a contest: You build a Celtic transmitter, and I'll
build a CW transmitter. Who ever gets on their air first and
is able to get 1000 QSOs is the winner.

> is able to get 1000 QSOs is the winner.

Ah, but remember, it was a hypothetical situation. If the rules
actually stated that you had to transmit in Celtic and Gaelic - then
there might actually be people transmitting in Celtic and Gaelic.

But I accept your point - CW does actually have utility, whereas Celtic
does not(anymore, at least)

Hey Jeff - you are always into arcane stuff like CW, sailing, and the
breast stroke - I bet you know some Latin too.

Hi all,

I have not heard any VK or ZL activity on RS 13 or 15 for ages, despite the beacons being quite strong. RS 13 is still sending Q5 telemetry and lifting the s-meter at this qth.

Must admit I am not a regular listener, but I have not heard a terrestrial station on these birds for a couple of years.

Late of last month, North American stations have been reported as being active on these satellites. So what is it with the South Pacific?

Cynicus.

Hi Everyone,

I'm looking for a Windows 95 based software package that will give me a view of the sky directly over my position, and let me orient the program view overhead to my position on the ground. I like going out in the summer evening onto my patio, and I just want to be able to grab my laptop, go out back, look up and compare this view with whats on the laptop.

The more graphically interesting the better.

Any suggestions are appreciated, please email me directly if it's not to much trouble.

Yes, they work VERY well. I'm in the process of finishing a 137 MHz "Egg-Beater II" based on dimensions from Jerry, K5OE. These have more gain on the horizon, and should be able to pick up low passes better. My QHA gets the wxsats from about 10-15 degrees, and I'm curious how much better the EggII is.
73, Jim

I am going to be on the road in Grid EN54, EN55 & EN44 June 26-28. Here are my plans for operation;

6/26:
AO27 = 03:09z grid EN54
UO14 = 04:33z grid EN54
14:14z grid EN54
15:53z grid EN54
6/27:
AO27 = 03:11z grid EN54
UO14 = 04:04z grid EN55
AO27 = 04:51z grid EN44
UO14 = 15:23z grid EN55

6/28:
AO27 = 02:44z grid EN54
UO14 = 03:34z grid EN55
AO27 = 04:23z grid EN55
UO14 = 05:14z grid EN54

I will work QRP with an HT and an Arrow (beam) antenna. QSL cards will go out to any new contact I make. If I worked you before and you want a QSL for this contact you can email me to request one. I am always happy to send out a card.

It is the only way... these satellites transmit line by line as they go
over, and you capture part of an endless band of picture.
So, any picture you receive from these satellites will always include your
own location.

Obviously, you're correct. Of course, the ACS group *I* belong to has a bunch of cops(city/county/and state patrolmen and detectives), firefighters, EMT's, nurses and the occasional public utility guy like me; along with the retired schoolteachers, etc. Kinda blows away THAT theory.

I'd guess that the professionals have chased most of the wannabes away. The city/county/ state guys just keep asking us for more. No black eyes, sometimes a few sore muscles. I guess we no-codes and restructured HF'ers are doing THAT all wrong, too.

"...Fat, lazy,... " Hmmmmm, bunch of us were up "on the mountain" installing a new repeater/link system for most of the infamous "Black Saturday" (April 15, 2000). One of the cops and I were swaying in the breeze above the sight for 6.5 hours, hanging antennae and hardline. Fat, lazy, semiliterate people don't climb with me...but, then again, I became a professional (Land Mobile Radio) long before I became an Amateur.

A good one that did that in the older days was SKYCHART 2000 it was an astronomy prog that also tracked sats in real time using kep elements, most satellite tracking programmes do not give you much in the way of star observations and vice versa with astro software, only the more "top-end" ones seem to incorporate sat tracking aswell...unless of course someone out here knows different then please correct me

Yes !,

Ideally you require a radio that covers the 137mhz band in FM mode with at least a 30khz bandwidth facility, then you can download the wxsat decoding software to turn the sound into pictures (free) then lastly a satellite tracking programme (winorbit is a free one) to know where and when the sats are..do a search and read up on it...it's great when you get your first ever pic :-)

Type of mode doesn't matter, an antenna doesn't care what it's
receiving.
These dishes have decent gain at S-Band and above, but you need to
fabricate a feed and suitable offset mounting for it. The original feed
was linear polarization, at Ku-Band, and isn't suitable for HamSat use.

David Findlay <nedz@bigpond.com> wrote:
>What form are the transmissions in and can you build a decoder?

The transmissions are on 137.xxx MHz in FM with a bandwidth of 30 kHz.
(this is a difficulty, as NBFM receivers are too narrow and WFM receivers
are too wide; you will need to put a different filter in an existing
receiver or build a dedicated one from scratch)

The demodulated audio has an audio tone which is again modulated by the
intensity signal while the image is scanned line-by-line by the satellite.
(actually there is no image; the satellite just scans the earth as it
orbits over it!)
Just plot this intensity signal line-by-line and you have an image.

You would normally not build a decoder anymore these days; software
decoders exist for an IBM PC with soundcard. In the past, hardware designs
and later microprocessor-based designs existed that store the signal in a
video memory and send out a TV signal. Before that, you would have used a
revolving drum with photographic paper wrapped around it, and plot the
lines on it using a light source modulated with the received signal.

The format most people receive is APT (Automatic Picture Trans-
mission), documented in Taggart, and online at:

http://www2.ncdc.noaa.gov/docs/klm/html/c4/sec4-2.htm

Set a scanner to listen to 137.3, 137.5, 137.62 and 137.85 MHz.
You'll hear satellites when they go over - they're loud, and
intended to be heard. I have some sample audio (wav and mp3)
on my web page at:

http://www.qsl.net/va3ldh/wxsat.html

(va3ldh will be changing to ve7ldh in the near future)

While you can build a decoder (Taggart describes a good one),
why bother? It's far easier to do it in software (use an
available program like wxsat, or roll your own). Doing it in
software produces excellent pictures at very low cost.
What more do you want?

The RF side can take a bit of tinkering to get right. I built
a crossed-dipole antenna over the weekend and it works well
with my homebrew preamp and modified scanner.

HRPT (High Resolution Picture Transmission) is another matter
entirely - 1.7 GHz and 665.4 kbps.are the key numbers. Start
with APT...

The images are transmitted using FAX imaging in FM mode, you will require a receiver with at LEAST 30khz bandwidth to get a decent picture. Software commonly used for decoding pictures is Jvcomm (http://www.jvcomm.de) very good) and a freeware one called WXsat
http://www.hffax.de/Software/software.html)
which is a very good programme especially for starters.

No special interfaces are required as these programmes only use your sound card input from your radio to make the image up.

My web site will be back up on the weekend (www.eavsdropper.dabsol.co.uk) so feel free to pop along as it will have a fair bit on WXsats.

cheers

JVcom32 apparently will demodulate the wxsat transmissions using only an audio patch cord and your sound card (SB16). However, for best reception your IF bandwidth needs to be about 40 to 45 kHz. It may mean a simple modification to your scanner to get this. It would certainly do no harm to try in the narrower bandwidths first.

The rx parameters are already loaded into JVcom32 and it only requires you to select the appropriate satellite from the list.

So far, JVcom32 has worked great in HF-FAX and SSTV at this location.

Others use the well known Hamcom interface (a 741 chip limiter) and WXSAT or JVFAX (both DOS).

While you are at it, WinOrbit (freeware) would be very handy to track the passes over your location.

It's very easy to do using a program called "wxsat" by Christian Bock.
It uses your PC sound card as a demodulator, and prints to screen, or
file, or both. The only thing you need to get excellent quality pictures
is a circularly polarized omnidirectional antenna, like a QuadraFilar
Helix, or an "Eggbeater" type antenna.
You can find information on all of the above doing a Yahoo search.

No, it is FM. And as I wrote, you cannot receive it on a scanner that has
FM either. You need a special receiver.

Let the flame wars begin!
1)It is an AM signal on an FM carrier [AM=2400Hz;FM=137.nnn]
2)You CAN receive it on a standard scanner[ie Pro34] with
NBFM. It has almost no detail, but you can spot land/ocean
edges, clouds the like.
3)Someone has a program that allows farily good reception
of NOAA/APT images with the same narrow band FM.
I have seen images produced this way, and while nowhere
as detailed as I like, they are impressive. If there is
interest, I can dig back through my "bookmarks" and see
I still have the URL. And while I still firmly believe
that you can not do what this program does, since it
does appear to work, I will accept that some guys know
how to cast very powerfull spells[ie are very, very
sharp programers!].
4)And that "special" receiver can be anything from a dedicated
Hamtronics WeSat receiver, to a PRo2004 in the WFM [yes it is TOO
WIDE, but it works great given a GOOD antenna and decent preamp.
An Icom PCR1000 works GREAT! Even on a less than ideal antenna.
If you doubt the reception of APT via a NFM receiver, give it a try.
Christian Bock has a freeware WXSat program that uses the sound
card to demod and display the image, so grab a trcacking program,
ding the next pass, get an AF extension cord, run it out a window to
your scanner outside, and grab a pass. You WILL be surprized!

Why? You should at least identify yourself for that.

>1)It is an AM signal on an FM carrier [AM=2400Hz;FM=137.nnn]

The receiver has to be FM. Period.
Then your second decoder has to AM-demodulate the audiocarrier, but that
cannot be done by using an AM receiver.

I described before what is to be special about the receiver.
Of course a WeSat receiver sounds a lot like a special receiver...

I once owned an FRG-9600 and its filters are sooo terrible that this may
even work...

But on a decent receiver with standard NBFM filters it will widely swing
out of the filters, and on WFM the SNR is less than you would like it to
be.

Most people commenting on how well it works on their unsuitable receiver
just have not seen how it is on the correct receiver...

1631. Press Release: Australian Amateur Satellite - Project BlueSat Presentation

Newsgroup: rec.radio.amateur.space
Date: 2000-06-21 00:00:00 UTC
From: Shane Magrath <shane.magrath@laker.com.au>
Message-ID: <8lU35.5164$c5.11526@newsfeeds.bigpond.com>
Source record: 9065

PRESS RELEASE

This post is advertising that the July meeting of the Waverley Amateur Radio Society will be hosting a presentation by The BlueSat project team, from the University of New South Wales (UNSW).

In what is believed to be an Australian first in many ways, the BlueSat Project is an amateur research project seeking to put an Australian micro-satellite into a Low Earth Orbit. The satellite will provide data and remote imaging services via the Amateur Radio ("Ham") frequency bands.

The presentation will seek to explain to the community what the BlueSat Project Team are hoping to achieve and how they plan to do it.

Robert Tot, one of the team managers, is reported to be "...keen to present on BlueSat and to obtain maximum input from the community regarding the Amateur services we will be providing."

All who are interested are welcome to attend the presentation and see first hand what Australian researchers are achieving in the field of space exploration.

The details of the presentation are:
Location:
Waverley Amateur Radio Society
Rose Bay Scout Hall,
Vickery Avenue,
ROSE BAY,
NSW 2029

1632. Re: RS satellites?

Newsgroup: rec.radio.amateur.space
Date: 2000-06-21 00:00:00 UTC
From: Jeff Griffith <jgriffit@installersinc.com>
Message-ID: <8ipgmsksq1@slb6.atl.mindspring.net>
Source record: 9066

I watched a friend make two VE contacts around 00:30 UTC on RS 12/13 from FN20. I had trouble copying the calling stations; they kept fading in and out unlike the downlinks from AO-10 and FO-20. He also mentioned that he had quite a bit of trouble with RS 15 the other night. His downlink from it was breaking up and the CW that came back was not intelligible.

Been asking the same question. RS 13 is still sending intelligible telemetry
but RS 15 has only an unmodulated carrier on the beacon. Apparently,
North American stations have been working both satellites quite recently.
I have not heard one single signal in the South Pacific for years. Pity, I
liked the mode A concept, it is unfortunate that these two will be the last.

73, Cynicus.

1635. Is MIR sending packet these days?

Newsgroup: rec.radio.amateur.space

Why?

If you think there should be more Mode A satellites, build and
launch one.

If you want more intelligent persons to speak with on HF, get rid of the CW exam and replace it with a Rubik's cube to "unscramble".

By choosing CW rather than mathematics, governments had choosen to limit HF hams to "robots" unable to think ! it's a choice ... accept the result ! :-)

The main problem for these "robots" is to think that thousands of PhD all around the world are going to access to HF bands without CW soon.

Clever people on HF : a new era for ham-radio !

How would one launch one these days? AMSAT can't even get Phase 3D up there with their assets...how does a poor ham get one into space? Mode A is ideal as there is no complicated antenna aiming required. I too will miss the RS birds when they cease to exist.

The launch is key, because we amateurs are 100% dependent on the
charity of others - we can't do it ourselves, and we can't afford
to pay the market rate.

Getting a ride for P3D is a challenge, because P3D is big -
almost the size of a small car. You don't lob that into orbit
for free! A smaller satellite is another matter.

Davidoff discusses many of the organizational requirements.
If you really want to put a project together, have a look.

Check out Nova for Windows. http://www.nlsa.com/
I picked up a copy at the AMSAT booth during the Dayton Hamvention.
As a long time Instant Track user, I must say that Nova is great. It
takes a few hours to get accustomed to using it. But now I don't think
I would go back to a DOS sat tracking program. I think there is a demo
version on their (Northern Lights Software Associates) website. It does
lists very well too.

Linear transponders rather than single channel FM repeaters,
significantly reduced ground station requirements, easy
tracking, easier access.

> If you think there should be more Mode A satellites, build and

I downloaded the WXSAT . Is there a chance that I might have a sound card already in my computer. It's a HP Pavilion 6535. I dont know much about computers. Also will the Yaesu FT-920, FT-8100R or the radio shack pro-64 do the job. One more thing, what type of cable will I need to run from my receiver to my PC. Thanks for your time and help. Sam, alphacentauri@i-plus.net

This is the ultimate NOAA APT Software in the universe.

Use it as follows:
Record the sat signal on the PC as wave file.
May be done with any recorder spftware,
best is to use WXSAT and record "wave and picture"
Thus you have immediate control during receiving.

Then use D.Taylor's program to process the recorded
wave file. See the difference.
There are numerous informations in the images,
eg surface temperature, which can be read with a mouse-click.

Taylor charges a small amount for his program.

hope this helps.

Leonid UA3CR, who was a very active force in the RS world, and had a
lot of contact with AMSAT etc, sadly died two years ago.

I am going to be on the road in Grid EN54, EN55 & EN44 June 26-28. I included local time incase i calculated for UTC time wrong. Here are my plans for operation;

6/26:
AO27 = 17:38z grid EN54 (10:30 local)
UO14 = 18:33z grid EN54 (11:33 local)
05:14z grid EN55 (21:14 local)
06:53z grid EN44 (22:53 local)
6/27:
AO27 = 17:11z grid EN54 (10:11 local)
UO14 = 18:03z grid EN54 (11:03 local)
AO27 = 18:51z grid EN55 (11:51 local)
UO14 = 19:43z grid EN55 (12:43 local)
UO14 = 06:23z grid EN54 (22:23 local)

6/28:
AO27 = 16:44z grid EN54 (09:44 local)
UO14 = 17:34z grid EN54 (10:34 local)
AO27 = 18:23z grid EN55 (11:23 local)
UO14 = 20:14z grid EN44 (12:14 local)
UO14 = 05:54z on the road (21:54 local)

I will work QRP with an HT and an Arrow (beam) antenna. QSL cards will go out to any new contact I make. If I worked you before and you want a QSL for this grid you can email me to request one. I am always happy to send out a card.

Does anyone know of things you can do with a DBS system like pick up signals from non directv/Dishnetwork satellites? Any "mods" (not card hacking)?

Along those lines what is the signal range of the LNB and could it be used to pick up non-DBS signals?

For DirecTV, there is little else up there, I think only a package on
G3r.

Dish has more flexibility the DirecTV, but not enough.

Ku is 11.7-12.2 Ghs, and linear polarized (H/V)
DBS band is 550 Mhz above normal Ku, and circularly polarized,

A primestar dish/LBF will do what you want, not saying you'll get
anything
though.

There is at least one article in QEX regarding the use of DBS dishes to receive 10ghz signals, and I believe there is a similar article in QEX on modifying the LNB. This was in reference to possible use with P3D.

I would say that qualifies as a topic for an amateur radio newsgroup.

Note that the satellite was not at Mars orbit when these tests were
done. It was out about 4 million miles on its way to Mars (78 million
miles). The rotation of the satellite was detected by the varying strength
of the signal. Detection of the signal with the satellite in Mars orbit
is outside the current practical state of the art for amateur systems.
In other words, Goldstone can do it, but lesser systems can't.

OTOH reception of Lunar Prospector in orbit about the Moon was
relatively simple. A number of us did that. Of course the Moon is only
a quarter of a million miles away. GEO (22,000 miles) and LEO (200
miles) are much easier, of course. LEO communications can be
achieved with an ordinary HT. It is also the cheapest orbit to reach,
important when you have to hitchhike a ride to space.

Perhaps a change in scoring would solve this problem (assuming the guy was working field day). Get rid of the 100 point bonus and replace it with several points per contact. Last year I know of at least one club that tore down their satellite station after their one contact, and moved on to more lucrative modes.

Maybe we could have a different "featured sport" with high point values each year: satellites one year, PSK31 the next, etc.

Hi Chris,

Mars Global Surveyor used to operate (I don't know if it is still active) a beacon on 437.1 MHz, at about 4 watts to an omnidirectional antenna. Amateurs successfully detected the carrier and proved doppler shift according to the Mars orbit and relative movement to earth. They used moderate antennas (a group of helices), non cryogenic preamps and very sophisticated FFT software, but all running on a PC/soundcard. You may want to have look at

http://www.webcom.com/af9y/

Interesting site anyway!

Exactly. They were a 2A. But a 1A could simply make one RS-13 mode K contact and move on to vanilla SSB or CW without changing any equipment. Whole lot more SSB and CW ops than sat ops. If he were in it for the points, he'd be dumb to stay a sat 1A.

My suggestion really boils down to whether or not we want to encourage folks to really exercise the newer modes.

You're seeing a footprint circle that's so small that it merges with
the satellite dot. This indicates that InstantTrack thinks your
satellite is in a very low (probably subterranean) orbit, which in
turn probably means that InstantTrack's Y2K bug has led it to believe
the orbit has been decaying for 100 years. Check this theory by going
to the manual edit elements screen, hit "D" to display the derived
elements, and examine the element set age.

If you find I'm right, then you're using an older, buggy version of
the program that converts Y2K Keplerian elements for InstantTrack. Get
the version from http://www.amsatnet.com and see if that one works any
better. If not, you can always adjust the date manually (enter 100 for
the year, I think) on the manual element screen.

Satellites on the moon have been proposed a few times. They are not
attractive when compared to earth orbit, but the proposal keeps coming up
every couple of years.

A trip to Mars was once suggested by the team designing Phase 3D. It was
mentioned during some lectures, maybe it is written down in articles in the
proceedings.
This project silently disappeared when Phase 3D plans became more
definitive.

To know if something is mentioned on the web, use a search-engine...

1672. Field Day

Newsgroup: rec.radio.amateur.space
Date: 2000-06-26 00:00:00 UTC
From: Jim Jerzycke <kq6ea@pacbell.net>
Message-ID: <3957901D.5ED39F1E@pacbell.net>
Source record: 9098

Am I the only one who had trouble working AO-27 and UO-14 this weekend due to a certain station who seemed to hog the whole pass?

I thought proper operating proceedure an FM sats was to use minimum power, make your contact, and GET OFF so other people could use the bird, ESPECIALLY on Field Day.

I suppose I'll get flamed on this, but did this guy not realize you only needed ONE satellite contact for the 100 point bonus, or did he not care?

Regards, Jim

To be honest I never thought any one station dominated the entire pass. It seemed that stations closest to the bird had the "capture" effect and that seemed to change as the bird moved down the country during the pass. I can clearly remember 2's 4's and then 5's "having" the bird.

It seemed to me that most let a stations report go thru before they keyed with their cq or report. At least that's what I heard and I heard all the passes.

Working those birds, with doppler, antenna movement and logging is got to be the biggest rush in amateur radio. When the bird goes out of view - you sit back and say "Wow"

At the Ham Radio exhibition in Fredrichshafen, Germany last weekend there was a demonstration of amateur digital video transmission. The receiver was a standard DVB (european equivalent to DBS) receiver from Nokia. This was fed from a modulation converter. The transmitter was a completely home brewed affair.

I'm selling all items listed due to serious illness. Package deals considered.

Yaesu FT-847 Satellite transceiver serial # 91250552
Purchased (new) as birthday present for me 3/8/2000
Covers HF, 6M, 2M and 70cm and works full duplex for satellite work.
1200/9600 baud packet ready.
Little used and in mint condition. Non-Smoker.
Asking $1200. Will ship UPS or Fedex (your choice). You pay shipping.
I will include Arrow 146/437-10 yagi Satellite antenna free of charge.
Also includes HF and Vhf Packet cables. Original box, packing, manual and factory accessories.

AEA PK900 Multimode Tnc Serial # 2352
Like new condition, All mode including Pactor, absolutely NO problems.
Has Latest 7.2 Firmware and DSP upgrade
Has AEA/Timewave internal 9600 baud modem, software selectable.
Has factory modem disconnect header, software selectable.
Perfect for satellite work.
NO mods or holes.
Serial cable included.
Selling for $350
You pay shipping.

Paccomm NB-96 9600 Baud modem.
Makes any 1200 baud afsk packet tnc with modem disconnect header into 9600 baud capable tnc. Front panel switchs modem in/out.
Sells for $119 new. Sell for $70 plus shipping.
Specs at www.paccomm.com

Paccomm PSK1 PSK Satellite modem
Makes any 1200 baud afsk packet tnc with modem disconnect header into 1200 Baud PSK modem for AO-16, LO-19 and IO-26 type satellites. Can also be used for 1200 baud PSK terrestial work and receive 400 baud telemetry format used by (late) ao-13 and upcoming P3D.
Sells for $239 new. Selling for $125 plus shipping.
Specs at www.paccomm.com

TAPR 9600 Baud modem
Makes any 1200 baud afsk packet tnc with modem disconnect header into 9600 baud capable tnc. Assembled, with docs on diskette. Formally used in PK-232 tnc. Kit sells for $80 new. Selling for $25 plus shipping. Specs at www.tapr.org

You seem bored with the idea! I see them as interesting projects to do because of the interest they would raise in the public not there utility for communications. But of coarse, if a set of small communications satellites where placed around Mars it would make losing probes less likely.

Dogpile! That is the search engine I use (www.dogpile.com).

1689. Linux radio receivers for SID work?

Newsgroup: rec.radio.amateur.space
Date: 2000-06-28 00:00:00 UTC
From: aaronp@removeme-shore.net
Message-ID: <06d65.74$YH5.14339@news.shore.net>
Source record: 9023

I'm looking to setup an online automated SIDS receiver to help monitor for GRBs, the Sun, and things that would affect forward scatter. Basically I need a radio kit that I can use to pick up 24Khz and hook it up to linux through an analog to digital converter and thereby record it. Then I can write a perl script to do all sorts of fun with it. I'm having a heck of a time finding any info on this though.
Does anyone know of an A2D converter that works under Linux? The WinRadio card works well (i use it to monitor meteor showers) but it doesnt go down as low as 24Khz.
Any help is appreciated. Thanks!

What have you done so far?

How is it failing?

Which mode?

What kind of sound card? Does it work as a sound card?

Kernel version, etc.?

Thats interesting- what format were they useing? MPEG2? If so, there are many off the shelf MPEG receiver/converter sets for the tvro market.

Receiveing should be the simple part of the equation...which from your message seems to be the case. Transmitting compressed digital video at reasonable frame rate takes up a fair chunk of bandwidth (certainly more than my cheesy 48k internet connection is capable of handleing). It is unfortunate that the amateur community has lagged in adopting and implementing high speed digital communication modes.

Although I eagerly await the launch of P3D due to financial constraints I am going to have to sell my dual band Icom and 2.4ghs downconverter setup... I was really hopeing to be able to play around with P3d's microwave bands, which is one reason for my initial question about non-standard uses for DBS hardware- the ku band stuff isn't all that far from the 10ghz band and there is a ton of stuff out there that could be modified... the 2.4 ghz downconverter I have is a drake wireless cable converter that a Japanese amatuer figured out how to convert to a 2m IF! Perhaps someone will be able to transmit digital video over p3d someday :-)

I am dusting off some of my sat gear and am in need of a tracking interface;
does anyone have one for sale? -Gerry

1700. AR5000+3 for sale

Newsgroup: rec.radio.amateur.space
Date: 2000-07-02 00:00:00 UTC
From: EAVESDROPPER <IAN@EAVSDROPPER.worldonline.co.uk>
Message-ID: <395fa41b@news.server.worldonline.co.uk>
Source record: 9034

I am considering the sale of me beloved AR5000+3 to pay for some ham equip and other stuff.

I would like to see what kind of offers people wanna make for it so e-mail me (ian@eavesdropper.worldonline.co.uk) if you are interested, SENSIBLE offers only thanks as I have a lot on my plate at the moment. It is 1 year old in mint condition, it has had a "proper straight out" discriminator tap to the rear socket (acc2) by reg ward (smc) ham radio shop, and I will sell it with all decoder software in my arsenal. Comes with box/manuals/leads and plugs etc and a car power adapter. Used mainly for space signals monitoring.

Current U.K market prices range from appx ?1450.00 to ?1549.00 (after searching the net) for this model new so use that as a guide.

I would consider PX with the following equip ?.

1) A decent laptop P.C /palm computer
2) A kenwood TM-D700E
3) A kenwood TH-D7E
3) A good GPS receiver

Any cash/px deals made will require a person-to-person meeting for exchange or cheque clearence will have to be done before dispatch!.

thanks

ian (eavesdropper)

1701. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.space
Date: 2000-07-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8joe38$5n9$1@news.hawaii.edu>
Source record: 9035
Cross-posted to: rec.radio.amateur.space,rec.radio.broadcasting,rec.radio.cb

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O

1703. Dial tones on AO-27?

Newsgroup: rec.radio.amateur.space
Date: 2000-07-04 00:00:00 UTC
From: perplexed <aa1ea@my-deja.com>
Message-ID: <8jsrd0ecm1@nnrp1.deja.com>
Source record: 9037

Hi All,

This might be a dumb question, but here goes!

I just build an antenna for receiving 436 MHz
for AO-27 and other sats. I knew an AO-27 pass
was about to come over, so I went out to my
car and attached the antenna to my dual band
xcvr.

I couldn't xmit because I didn't have a switch installed
yet or a duplexer.

I heard the bird pretty well, considering this Kenwood
TMV-7A is a bit deaf on 440. But I also heard touch tones
and _dialing_ between a few of the contacts.

There were stations from Maine, Ohio and NY on
and I swear someone was dialing, like in a phone patch
and there was a dial tone!

Whatzzzz Up with this?

TNX ES 73,

Larry

I would like to receive the images from the weather sats and any
any others. I downloaded the WXSat and I have a sound card. I
guess now all I need is the receiver. What will work. I have the
Yaesu FT-8100R, PRO-64 and the Yaesu FT-920. I dont guess any of
these will work will they or will they. If not could someone
recommend a good inexspensive one. Thanks, Sam

Larry,

You could be hearing a phone patch link. Some times it cost to much to have
the Phone Co. put in a line at the repeater site so you link the phone line
to the repeater on another freq..

FAQ: visit http://www.amsat.org

You'll need the information there to figure out AO-27's
TEPR scheduling, in any case.

0. Pick up a copy of a reference like Taggart's weather satellite
book. While a little dated in some places (like sound cards and
the fun you can have with them), it's excellent in every other
respect. Buy it!

1. Antenna: I've used single dipoles, crossed dipoles, small
beams, Lindenblad, quadrifilar helix - they all work, to
varying degrees. They all have limitations. My first (really
bad) picture was on a rubber duck. Experiment!

2. Preamp, if needed: I started out without one. Then I
tacked a little MAR-6 job together. Then I built a BF961
preamp.

3. Figure out when satellites will be in the sky. I use sattrack,
which is also handy for questions of the form "When is the next
weather satellite due?"

4. Listen. The satellites are loud, and you will hear them.
Feed the results to the computer and see what happens.
Tip: record a pass or two to a wav file (11025 Hz/16 bits
for WXsat) so you can play them back at your leisure to see
how the software works.

My receiver is a modified Pro-43 scanner. I got my early
images (some of which were quite good) before I modified the
scanner, not being quite smart enough to understand that
receiver bandwidth was a life-and-death issue. Crummy pic-
tures are better than no pictures at all... :-)

Be prepared to experiment, and be prepared to tinker. That's
how this stuff works.

RS1's batteries failed shortly after launch, but it very often sent garbled telemetry on its 29.401MHz beacon when it was in sunlight. I was reminded of it when someone on the RS12/13 forum asked about it. I last heard it in 1988 (when it took a fair amount of detective work to track it as it was assumed that no-one would want elements for a satellite with a dead transponder, and of course there was no internet!)

It's extremely unlikely that the solar panels are still working a further 12 years after I last heard it, but I wondered whether anyone had heard it since then. In case anyone's interested...

Windows 95/98/98SE all act weird sometimes.
As a first step, make a batch files that calls IT and has "SET=CST7CDT"
before IT.EXE. If that does not work, try cahnging the properties of
IT to "hide windows from this program".
And if all else fails, exit to "MS-DOS" before running IT.
BTW it works great on my p233 with 98SE.

Satellite Tracking Programs
FodTrack 2.5 (190K)
A simple, straightforward program intended to control azimuth-elevation
rotators, now with transceiver control for Doppler tracking and support for
a GPS receiver for automatic time and position. Simple text display. The
rotor controller is connected to a parallel port (circuit diagram included),
or via a GS-232 or RC-2800 serial interface. Implements rotor flipping and
automatic control. Written by Manfred Mornhinweg, XQ2FOD. (See also FODDRV,
a KCT-compatible rotor driver for the FODTRACK parallel port interface, and
FOD-INIT, an interface from WiSP to FODTRACK.)

Program and info is available at http://www.amsat.org/amsat/ftpsoft.html

And there's a DDE for using it with WISP and The Station, apparently.
I'm definitely up for one, or maybe two.

Go to the amsat.org webpage and look under the download files section
for a program called fodtrack. It is a simple program to track the sats
and a very nice and cheap interface for the az/el rotators. Also does
some frequency tracking for some of the radios. I have one I ordered
from the club in South America. The circuit board is fine, but he box
it is in is not very nice, but it sure gets the job done.
The program is free and the schematic for the interface is included.
The circuit could probably be built for $ 10 to $ 15 and a few more for
the box to put it in and some cables. One for the printer port and one
to go to the rotator box.

Sometimes I run that program and another fancy graphics tracking program
at the same time in windows. ONe for the rotator and one to look at.

I realize that this is the wrong group, but I'm hoping someone will see
this and know where I can find a book on this repeater.
I have one of these units in which the receiver "drops out" after a
"warming period". Can anyone help me find a manual and/or schematic?

It now looks like there is interest in about 10 boards, so I will place an order for that many when I return from New Orleans next week.

If each person who expressed an interest would send me an e-mail, directly (see nospam instructions at end of message), with the number desired, I would appreciate it, just to make sure I have an accurate count.

The interface is also supported directly by The Station Program and Nova for
Windows.

j-man on January 16, 1999 at 16:36:37:=20

Now here is how you can make Millions of $$$$s or =A3=A3=A3=A3=A3s or =
any currency in the world!!!=20

PRINT THIS PAGE NOW OR YOU WILL BE SORRY!!!!=20

Now you probably have been scanning different news groups to find out =
which one is the best, haven=91t you? I certainly did. But don=91t leave =
just yet. You=91ve probably seen newsgroups which start =90 I was =
looking through a newsgroup, just like you are now=91 =90I was sceptical =
at first=91 and =90I=91ve spent more than that on lottery tickets=91 I =
have seen many of them around. Asking for you to send $6 and you=91ll =
receive $15,000.=20
Well I=91m asking you to send $10 and receive well over $5,000,000 (5 =
million bucks).
I know it sounds crazy but here is what you have to do. Follow the =
instructions CAREFULLY.=20

1) Get 10 $1 bills and wrap them in separate pieces of paper each saying =
" Add me to your mailing list Please." Also your name and address.=20

2) Put these separate pieces of paper and put them into separate =
envelopes, sending each one to the names below. You should now have 10 =
envelopes with each $1 in and with your name inside.=20

3) Now you need to send this message to 200 newsgroups on the Internet. =
What you do is put your cursor at the top and highlight it all and =
select =90copy=91 then open up =90Word=91 or anything to write on and =
select =90paste=91. Now all you need to do is place your name and =
address on the number 10 spot and move everybody up a place, so 10 =
becomes 9, 9 becomes 8 ect, ect, now knock number 1 off the top, so 2 =
becomes 1.=20

4) Here are the names you need to send the money to.=20

1) R L Enterprises, P.O. Box, 808 Festus, MO 63028, USA=20

2) W.C. Daniels, 5910 Transit Rd. Depew, NY 14043, USA=20

3) Chris Adkins, 127 Cupsaw Dr., Ringwood N.J. 07456 USA=20

4)Simon Belgian, 1212 Viola Ave., Glendale CA, 91202 USA=20

5) Creative Consulting, 4302 N. 16th Ave., Phoenix, AZ 85015 USA=20

6) M L Enterprises 27-1300 King St. E. Box 135 Oshwa Ontario, Canada L =
1H-8J4=20

7) S. Soudakov Elmshurst House Bromsgrove School Worcs B61 7Du England=20

8) S. Kerr 21 Serpentine Rd Selly Park Birmingham B29 7HU=20

9) Ewan MacTaggart 10 Cordingley Close Churchdown Gloucester GL3 2EN =
England.=20

10) Pauj Espon Enterprises, 441 Avocet Ave. Davis CA 95616 USA

Now this is how it works.=20
As you post this, to 200 newsgroups and people read and think =90 Ah I =
will join up to this.=91 And let=91s say only 5 people reply (a very low =
number)=20
That is $5. Now those 5 people send out 200 news groups and follow the =
instructions as your name is at number 9. Lets say 5 people answer to =
each 200 news groups, then that=91s another $25. Now if they follow the =
instructions carefully, your name is at number 7 and you get $125. Now =
if those 125 people send out 200 news groups you receive $625. And again =
your name moves up to 6 and you receive $3,125. They now post the news =
groups and your name moves up to 5 and those people reply you get =
$15,625. Now this is where the newsgroups I was speaking about earlier =
finish, that=91s it. $6, 6 places. But now your name is now sent out at =
your name at number 4 and you receive $78,125. Your name has still got 3 =
more places to go yet. So now with your name at no 3 you get a whopping =
$390,625. Once again your name moves to 2 and you are going to receive =
$1,953,125 (1 million nine hundred and fifty thousand, one hundred and =
twenty five dollars!!!!!!) But wait, you=91ve got one more place to move =
up. Number 1. You will receive $9,765,625. Can you grasp how much that =
is Nine Million. Oh no, your name had drooped of the list, oh well just =
start again and get some more MILLIONS rolling in. These numbers have =
only been calculated, if only 5 people respond to each 200 newsgroups, =
just think of how many people are on the net!! It has been estimated =
that 20,000 to 50,000 join the Internet every month!

The reason why you must send off the money in the first place is that =
you create a legal service and this is not fraud. If you did NOT SEND =
THE MONEY then you would be committing FRAUD and can be put away, =
because you are using other people=91s name for your own good.=20

Please play fairly and send the money and you will receive tons, in the =
next few weeks!!=20

Radio Meteor Observation Bulletin No. 83 July 2000

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Paseo Bonanova, 8 Barcelona (02 07'E, 41 24' N)
Frequency: 48.24715 MHz.
Transmitter Location: Biedenkopf C2 TV, Video Frequency 48.250 MHz,
ERP 100 kW, Azimuth 90 +/-65
Antenna: Six element Yagi 617-6B, 14 dBi gain, horizontal polariz.
Azimuth 200 deg (NE), elevation 20 deg
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (500 Hz) and fed into the PC in real time.
Data sampling system: own written software "MSD" with sound card.

Observer: Michael Boschat
Location: Halifax, Canada (63 36'W, 44 39'N, 58 meters above sea level)
Listening Frequency: 83.24 MHz
Receiver: Icom R-10
Antenna : resonant dipole
Antenna Direction: Horizontally polarized with lobes in E-W plane, elev 0 deg
Filter : high-Q (Q at least 300) bandpass filter between antenna & receiver.
Listening Mode: CW
```

Recording method: listening by ear

Notes:
. no corrections for radiant position made to the counts.
. - = no observations made.
. * = interference

Mike Boschat

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi (x form), 4 elements, astronomical azimuth 270 deg (= E), elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal

generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB.
SWR of antenna alone at 66.5 MHz: 1.4/1 (good to very good),
measured with MFJ/259P SWR analyzer (HF-VHF 1.8 MHz to 170 MHz)
on Sep 28, 1998.
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the Ghent University format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

Didier Favre

Location: Astronomical Observatory, Ghent University, Belgium
(ED50 coordinates: 3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
narrow band resonance lambda/4 antenna filter
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Note:
. interference, mainly sporadic E and thunderstorms, mutilated this month's observations. An increase around June 10 due to the zeta Perseids.
Almost no observations during the activity period of the beta Taurids
at the end of the month.

Pierre De Groote

Observer: H. W. Kelsey
Location: Conway, Arkansas USA (92 25' W, 35 02' N)
Frequency: 89.5 MHz
Transmitter: Tulsa OK & Salina/Manhattan KS
Receiver: Sangean 803A
Antenna: Yagi Heading: SNW
Antenna: Yagi Heading: NW or SNW
Observing Method: Recorded on Audio Tape

Underdense/Overdense Scale:
Overdense: 0.5 second or more duration
Underdense: less than 0.5 second duration

Each observed hour is 60 minutes, exactly.

R.B. Minton

Observer: Ton Schoenmaker
Location: Roden, Netherlands (06 26' E, 53 08' N)
Frequency: 55.275 MHz
Transmitter: Spanish TV channel E3 (video); transmitters in La Muela (30 kW), Gamoniteiro (50 kW) and Aitana (60 kW); all stations within 100 Hz of nominal frequency; distance ~ 1500 km
Antenna: 4-element horizontal Yagi, geographical azimuth 195 degrees (SSW), elevation 15 degrees
Receiver: Yupiteru MVT-9000 in FM mode; sensitivity 0.5 uV at 12 dB S/N
Observing: audio signal from ear-phone socket was rectified, digitized and fed into a PC via the parallel computer port. HP VEE was used to process the digitized signal and to store 15-minutes counts of reflections stronger than 0.063 uV (-131 dBm). Also for all individual meteors date, time, duration (dead time) and maximum

signal are stored.

June 2000

Uncorrected hourly counts for signals stronger than 0.063 uV

Notes:
-: no observations
*: affected by enhanced ionospheric or tropospheric propagation
At many times the counts were affected by sporadic-E or tropo conditions.
All hourly counts with more than 10 minutes dead time were discarded.
Under normal conditions the dead time per hour ranges from 1 to 7 minutes.

Observer: Garfield Tsao (BM2EQB)
Location: LonTan Observatory
LonTan, TauYan, Taiwan R.O.C. (121 14'37" E, 24 52'54" N by GPS)
Frequency: 50.0169 MHz USB mode 3 kHz width.
Antenna: Comet made 50 MHz Yagi HB 4 element (gain 10.3 dBi)
astronomical azimuth 225 deg (=NE), elevation 7 deg.
Transmitter: MIYAZAKI University Japan, USB mode, 50 W (24 hours),
distance about 1125 km from Lon Tan.
Receiver: Icon PCR-1000 computer controlled all band receiver
Sensitivity: 0.25 uV for 10 dB S/N for USB mode
Observing method: the beacon 880 Hz voice signal (by FFTDSP) is
received by a low frequency filter (880 Hz)and fed into
the D/A converter and computer in real time.
Data sampling system: using an 8 bits A/D card to PC/AT and Qbasic program
with 1/8 second sampling interval to store the> 1.0 s reflections.

Notes:
. Arietids and z-Perseids activity was as always. The MS-data gathering
system is running well on two frequencies 88.7 and 88.8 MHz with their
different threshold settings + the Aurora receiver that is replaced now
with another unit. The post-processing frequency diversity filtering seems
to reject automatically from the distributed data at least one out of four
non-meteoric propagation events during this period. Calibration (conversion
algorithms) of meteoric data is reasonably close. Please note there was
aurora on the evening of 8th and strong full day lasting sporadic-E

propagation (including rare Spanish FM stations) on 11th plus few shorter events on 11th and 12th.

Ilkka Yrjola

2. ANNOUNCEMENT

We would like to inform you about our new project MARMO! Which stands for Multi-Antenna Radio-Meteor Observation. We succeeded in observing meteors by radio using more than one antenna! To know more about MARMO please visit:

http://www.jas.org.jo/marmo.html

Mohammad Shawkat Odeh.
Jordanian Astronomical Society (JAS).
odeh@jas.org.jo

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

1732. Warning! -- SONY SUBSTANDARD SERVICE

Newsgroup: rec.radio.amateur.space
Date: 2000-07-08 00:00:00 UTC
From: An_American_Consumer@uorll.gov
Message-ID: <0B841DAAF8888DC.zcycceyoau@blsyuscees.net>
Source record: 8966

Anyone considering the purchase of a Sony peripheral for their computer
might want to give it some further thought. There clearly is not a
reciprocal relationship between what they sell and what they service.
-
I purchased a CD-RW drive back in April that just recently went bad
(won't read). When I called Sony service, I was told that I could not
get a replacement and that I had to ship it across the country to be
"repaired" (and we all know what that means...) - with a three (3) week
turnaround. Assuming that they keep their 3-week commitment, with
shipping both ways, I'd be without the use of the unit for at least
five weeks!!!
-
I hardly think that's reasonable or fair.
-
Compare this to HP, who under the same circumstances would simply ship
you out a replacement unit and issue a call-tag for the old one.
-
Sony is a behemoth in the marketplace and as such, they have an
obligation to scale their service facilities to meet demand. To not do
so is an indication of their lack of commitment to customer satisfaction
and an unwillingness to stand behind their products.
-
Buyer be ware!
-
-
-

1733. satellite photos?

Newsgroup: rec.radio.amateur.space
Date: 2000-07-08 00:00:00 UTC
From: Gerry and/or Robin Lempicki <lempicki@psych.umass.edu>
Message-ID: <3967ec37$1@oit.umass.edu>
Source record: 8967

Does anyone know of an online source of photos of amateaur satellites? I would like to be able to show people what the individual sats look like as we hear them. Thanks! -Gerry

1734. Archive of Photo's FROM Sats ?

Newsgroup: rec.radio.amateur.space
Date: 2000-07-09 00:00:00 UTC
From: g0lfp@hotmail.com
Message-ID: <memo.20000709134428.50497A@g0lfp.cix.co.uk>
Source record: 8968

I would be interested to know if there is an archive of Sat photo's from amateur sat anywhere on the web... particularly from uo-36 ?????

Hi all,

I have loaded Traksat 4.00 onto a DOS machine (386, circa 1991).
This programme appears to have a Y2K bug in reporting UTC time,
i.e. it gives the wrong day and UTC time.

However, Hamcomm and JVFax do not suffer from the same effect
on the same machine. Leading me to believe that the problem is with
Traksat.

Nevertheless, has anyone else experienced this problem with Traksat,
and if so, is there a patch fix?

Thanks in advance, Cynicus.

1739. tracking program for a Hp100 without y2k problems??

How is the time mis-reported? Does it work if you set the
system date to before 1 January 2000?

The issues in programs are generally the year rollover, and
the fact that 2000 is not a leap year - some programs did in
fact break on 1 March 2000.

Traksat 4.00 is pretty old (1996). Have you contacted the
author?

It depends on what satellite you're using. Some track normal, some reversed. Go to www.amsat.org and look at their "Working the Easy Sats" article. Also re-read the '847 manual. I think it tells which are which.

Have had the same problem with Traksat myself. It certainly seems
to be a Y2K glitch. Even with using local time as default it is giving
the wrong passes and reporting full daylight when I know full well
that it is past sunset at this QTH.

I could not get Real95 to work at all.

Sorry I can not help you with your specific problem, Mike. I can
only offer sympathy. :-)

Cheers, Cynicus.

Check the settings in the traksat.ini file. In this file, you can specify
your UTC offset hours depending on where you live. Use any text editor to
make changes to this file.
I've used Traksat for 10 years with no problems and its outlasted 3
computers.

>ellipitcal orbit ones.

The design objective for Phase 3D is that the link budget would be about 10
dB better than for Oscar 10 and 13.
I have worked Oscar 10 in the past with a 15 el crossed yagi and about 30
Watts. According to information published before launch, that would have
been more than enough. But in practice, I was a very weak station.

This is because there are always enough people using more than the required
amount of power to cause the AGC to limit the gain of the transponder, and
therefore to require everyone to use more power. This is a runaway
situation that ends up with only the big guns being able to use the
satellite.

Phase 3D is supposed to have some countermeasures for this (retaliation
against stations using too much power, instead of giving them the best use
of the transponder), so it should (together with the better performance of
the satellite) be possible to work it with 10 watts on that 11 el yagi.

However, don't count on that until you have actually done it.

BTW, you should not count on being able to uplink on a certain band. There
are many possible transponder combinations, and seeing how well the 23->70
transponders worked before going defective, that will probably be a more
popular mode than 70->2. Maybe 70->13 will be used?

> How is the time mis-reported?

One UTC day in advance and the wrong UTC time by 4 hours, for
the correct offset regards K time (Sydney, EAST). However, settting
Local Time as the default, in other words using the PC clock as the
standard direct, results in a correct time display but the passes are
irrelevent and the sunlight display is quite obviously very wrong.
Perpelexing by 4 hours.

Using an erroneous offset, one different from this time zone by
4 hours may be an answer but that is not what the author intended,
and it is not a real answer to the problem.

Nevertheless, Winorbit works faultlessly on another machine, one
which my kids don't let me use that much. Gee, it's fun being a
parent. HeHeHe, the Old Man only gets to play with the DOS
machine! Anyway, it functions much better as a communications
driver.

> Does it work if you set the

I have done that, Joe. There are still some problems with the execution
regardless.

It does the same thing on my multimedia machine, which is much faster
and has much more resources than the old DOS beast. Perversely, the
DOS machine is superior in many ways than the more upbeat graphical
machine. HA, it doesn't have an hour glass!!!

> I've used Traksat for 10 years with no problems and its outlasted 3

Interesting. Have you experienced any obvious problems with Traksat
this year, or since Feb 28th?

It just has me stumped. I have suffered no previous ill effects from the
Y2K bullshit, until now. I did not believe it would happen. Even my own
BASIC routines I wrote 10 years ago still do their stuff without any
chagrin.

Cheers, Cynicus.

If it doesn't work, why not use something that does?

I use sattrack most of the time - I like the Mission Control-
style tracking displays, and find the multiple tracking facility
handy for answering questions of the form "when is the next
low-orbit/digital/weather/etc. satellite due?"

Predict is handy too - it's small, fast and simple to use.

Predict is fully Y2K compliant. Sattrack had a small issue,
but a patch was posted on this newsgroup and works just fine.

I think Instant Track (atleast the older version I have) has a y2k bug
in it and there is a program that needs to be ran on the element sets
that lets it work.

Don't believe it is sharewear either.

Phase 3D has been Real Soon Now for the entire duration
of my association with AMSAT. Either you keep the faith,
or you don't. If you do, you look at the up- and downlinks
that look promising, see what you can do about them, and
generally hedge your bets (e.g. terrestrial microwave).
If you don't, it doesn't matter anyway.

I'd be lying if I said my faith was as strong as it once
was. But that's another matter.

You have an Amiga? Nice computer but a bit out of date. As for as
the Amiga being Y2K compliant, don't worry it already is and it is
good to 2060. Is the Amiga a popular computer over in the UK? In the
USA the Amiga dropped out of popularity with the advancement of the PC
and Windows 95. Good luck on your hunt but I would advise getting a
Mac or a PC, It's a lot easer getting software for these two
platforms.

Good Luck, Rick KC2ESD

Help!

I am looking for other Naval Academy graduates or US Naval personnel who can assist me in saving the amateur radio club at USNA.

I have been the officer rep for the past 2.5 years, but a decision was just made in the past 48 hours (over the summer while the mids are conveniently out at summer training or on leave) without notice or discussion, to disestablish the station W3ADO (also Navy MARS station NNN0NNN). Perceived lack of participation, lack of knowledge of our various missions and accomplishments ("oh, ham radio is dead..."), and funding probably played a role.

Mailing address for support letters:
Captain Sam Locklear, USN
Commandant of Midshipmen
101 Buchanan Road
US Naval Academy
Annapolis, MD 21402

cc me at:
Ryan "Skip" Johnson
510 Norton Lane
Arnold, MD 21012
k3for@aol.com
if you can

Or if you can't write a letter, please email me something and I will forward it to the Deputy Commandant by email.

Thank you ! I only hope its not too late -- I have to run down there and see if they've thrown out the gear already...

Better still, build a Linux box. Linux is probably more in keeping with the Amiga look(s) and ethos (not to mention native support for AX25). It may even be possible to run Linux on an Amiga.

But the reason to "keep the faith" now is better than ever before. We are manifested in the next three months on an Ariane 5 that is not just a test flight, but a fully operational one that stands a high probability of success. We also have had an extra three years to shake, rattle, and roll the bird, and work out the kinks in it. There were several problems found with it during this testing that were made public, but were corrected during the wait.

In summary, I think we're likely to have an excellent bird that will serve the amateur community well for a decade or more. It should revitalize the amateur space program worldwide.

1774. Phase 3D delayed?

Newsgroup: rec.radio.amateur.space
Date: 2000-07-16 00:00:00 UTC
From: Norman Kenyon <g4ayu@airtime.co.uk>
Message-ID: <39717499.87BC07B3@airtime.co.uk>
Source record: 8908

This latest news release may put the launch of Phase 3D back a month ot
two.

....

Mission Update:
Flight 130
July 13: A mission stand-down after a hardware warning

The smooth launch campaign for Flight 130 has been interrupted because
of an
anomaly detected during endurance testing in Europe on a future version
of
Ariane 5's upper stage.

Activity at the Spaceport is now focused at putting the Flight 130
launcher
and its dual satellite payload into a standby mode until a new liftoff
date
is set.

The mission was postponed after the anomaly during a long duration
attitude
control system ground for the future "Versatile" version of Ariane 5's
EPS
upper stage. In the wake of the anomaly, a warning was issued for the
similar attitude control system that is installed on Flight 130's Ariane
5.

When additional checks were unable to confirm the flight readiness of
attitude control system hardware installed on the Flight 130 vehicle,
Arianespace made the launch postponement decision.

The attitude control system uses hydrazine propellant, and is integrated
in
Ariane 5's vehicle equipment bay. It provides roll control during
operation
of Ariane 5's main cryogenic stage after the solid rocket boosters have
separated from the launcher. The attitude control system continues to
function during powered flight of the upper stage, ensuring three-axis
control for all satellite positioning maneuvers.

A new launch date for Flight 130 should be announced soon, with the
mission
now anticipated for the first half of September.

This means that Arianespace's next launch will be Flight 131, which is targeted for August 11. Flight 131 will use an Ariane 4 to orbit the Brasilsat B4 and Nilesat 102 satellites.

END

Source record: 8911

Hamish: I use a commercially made turnstile antenna for satellite work. It is made by Cushcraft. I don't recall the model number but you can find details and pictures of it on the Cushcraft web site. Just from its appearance I can tell you it is nothing more than a pair of two crossed horizontal dipoles with one element is each pair being a driven element.Looks like about a foot, 12 inces, between the pair. They are beamed straight up and worked for me the first time I used them. It is a nice antenna and eliminates rotors and steerable beams (although I have that too). Since the first weekend in September 1999 I have worked 36 states and a half dozen DXCC countries. My best contacts have been on RS-13 (up on 2, down on 29 mhz), UO-14 (great bird!) and SO-35 (a neat satellite). I was called by a CT1 in Portugal on AO-10 using the turnstile but did not establish a qso with him. I have had no luck working the FO20 or FO29 birds with the turnstile. You might want to investigate the eggbeater antennas made by M2 (that's M-square...see their webb site). On the turnstile I use a Icom 271A on the uplink and Icom 740 (HF) or Icom 471A (435 mhz) on the downlinks. Now let me see if I can find that model number: t416tb. Not sure about that number. I hope this helps. BTW on the steerable array, an old Cushcraft AOP-1 (Oscar Pack) I use a new Yaesu FT-847. 73, Pat, K4AVO

There may not be one - but this stuff is well covered in just
about every VHF/UHF/satellite ham radio book printed in the
last 30 years. Just how detailed do you need?

Briefly, you need two dipoles. They will be at 90 degrees to
each other, and must be fed 90 degrees out of phase. How you
do this is up to you. The antenna I use at home uses quarter-
wave phasing lines and works fine.

Depending on the exact pattern you want, the ground plane will
be something from 1/4 lambda to 3/8 lambda below the dipoles.
It must be at least one half wavelength across.

Have fun.

1780. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.space
Date: 2000-07-18 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8l12a5hdv1@news.hawaii.edu>
Source record: 8914
Cross-posted to: rec.radio.amateur.space,rec.answers,news.answers

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the

group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Body handling: Binary attachment payload not displayed: helper.vcf

Dear Specialist

I have a important question about recevice the satellite imagery and

weather chart by wireless method, I need to looking for the wireless

Radio have All-In-One function, that mean is Transmit HF/VHF/UHF

frequency Include (SSB Morse Code Transmition) and Recevice the All

band even NOAA Satellite Imagery ,I found that NOAA Satellite normally

transmit - SSB Band with Frequency between 137-138MHz .

Finally , I found the Yaesu HF/50/144/430 ALL MODE TRANSCEIVER

(Satellite Version), the Specificationas show as below...

http://radioinfo.co.nz/ft847/ft847spe.htm

http://www.macawelectronics.com/yaesu/ft847.html

I GUESS this model can coverage the satellite signal,but I have some

question still....

1. Does it(Yaseu) suitable for Recevice Satellite Imagery from NOAA?

2. Can I use the Qualifilar Helix Antenna and Yaseu to recevice

Satellite Imagery ?

3. Also,Do I need more Accessories except Antenna and Recevice ?

Please Help and Suggest.

Thanks very much.

Dear Matt

Hello, Thanks for help.

I just very happy u had experience for using FT-847 to recevice NOAA

Satellite Imagery, but it not good for recevice NOAA Imagery ?? NOT

ENOUGH the Narrow ? I just was thinking 847 is excellent for recevice

include NOAA even it can transmit before ,but it include Satellite

function ? for what usage ???

If compare with the Icom-R8500 and Icom-PCR 1000 Recevice ,

whice one is better for recevice NOAA Imagery ???

What kind of your commercial wx sat radio , antennas and how

much for that $$$??

I would like to know about your weather station,Please tell me .

Thank You Sir.

Helper.

You may need to modify the 847 with a special filter 30 or 40 KHz
bandwidth,
and if used as NOAA receiver, it must have AFC..

there are very few commercially avaliable radios that TX/RX and cover the bands you mention "and" also have at least a 30khz wide filter for wx..in fact I cannot think of any that do all that, which I do not understand personally I think this is a serious shortcoming on the part of the manafacturer, it does not take much to fit in a 30-50khz switchable filter into an amatuer radio and it would be a most useful addition to all those ham radios that cover the WX frequencys.

please take note icom, kenwood, yaseu etc.

ian

Question: other than weather satellites, what applications does
a 50 kHz FM bandwidth have?

Yaecomwood will want to know.

1787. ARRL and TAPR 19th Annual Digital Communications Conference

Newsgroup: rec.radio.amateur.space
Date: 2000-07-18 00:00:00 UTC
From: srbible@gate.net
Message-ID: <3974eb94.9995703@news.gate.net>
Source record: 8921

ARRL and TAPR 19th Annual
Digital Communications Conference
September 22-24, 2000 - Orlando, Florida

For more information see: http://www.tapr.org/dcc

Information
Mark your calendar and start making plans to attend the year's premier

event in digital communications. The 19th Annual ARRL and TAPR Digital Communications Conference will be held September 22-24, 2000, in Orlando, Florida - just minutes from the Orlando International Airport.

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results,

and practical applications. The Digital Communications Conference is not just for the digital expert, but also for digitally oriented amateurs of all levels of experience.

A Conference for the Beginner as well
The conference is not just for the digital expert. As in years past an entire session strand with beginning, intermediate, and advanced presentations on selected topics in digital communications will be offered. Some of the topics will include: APRS, Satellite Communications, TCP/IP, Digital Radio, Spread Spectrum and other introductory topics. Come to the conference and hear these topics presented by the experts!

Area Attractions
The Orlando Florida area is famous for its attractions and vacation spots. Disney World, Universal Studios, and Sea World (just to name a

few) are within 15 minutes of the hotel. Shuttle service from the hotel will be available for a small fee. Cape Canaveral and Cocoa Beach are a 30 minute drive East of the hotel.

Symposia, Seminars and Banquet
Two symposia/seminars will be held which allow those with additional time and interest to make the most of the Conference. For those who may have interest in just one symposium or seminar, registration for the conference is not required to attend these activities. This allows

maximum flexibility for those who may want to participate during the Digital Communications Conference, but do not have an entire weekend to devote to the event.

The Fourth APRS National Symposium will be held on Friday and will be moderated by Steve Dimse, K4HG (the developer of javAPRS). It will likely include many APRS software authors, such as Bob Bruninga, WB4APR (the father ofAPRS), Keith Sproul, WU2Z, Mark Sproul, KB2ICI (the developers of MacAPRS and WinAPRS), Brent Hildebrand, KH2Z (the developer of APRSPLUS), Mike Musick, N0QBF (developer of PocketAPRS), and other nationally known APRS leaders. Join this group for the afternoon and evening for in-depth discussions and presentations on the current and future status of APRS. This is a unique opportunity to

gain insight into this fast-growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

On Saturday night the DCC Banquet will be held. A guest speaker will speak after the banquet and a prize drawing will top the evening. The

Grand Prize is a Palm VII Personal Digital Assistant.

The Sunday morning seminar will be focused on PIC development, design, and programming. This five-and-a-half hour seminar will focus on the things you need to know now in order to understand and begin to

participate in PIC development.

Co-Hosts
The 2000 ARRL and TAPR Digital Communications Conference local co-hosts will be Lake Monroe Amateur Radio Society (http://www.qsl.net/lmars/),Orange County ARES/RACES(http://evcom.net/~jvoisin/ares.htm), Seminole County ARES/RACES (http://wwww.geocities.com/capecanaveral/launchpad/4773), and Orlando Amateur Radio Club(http://www.oarc.org/).

International Co-Hosts PRUG (Packet Radio User Group of Japan) will be

the International co-host for a third year running. PRUG will be hosting an informal social Friday evening before their seminar and symposium is held. Visit http://www.prug.or.jp for more information about PRUG.

Call for Papers
Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. Papers are due by August 7th, 2000, and should be submitted to

Maty Weinberg, ARRL
225 Main Street
Newington, CT 06111

or via the Internet to

lweinberg@arrl.org

Information on paper submission guidelines are available on-line at

http://www.tapr.org/dcc

Hotel
Conference presentations, meetings, and seminars will be held at the Orlando Airport Marriott. It is highly recommended that you book your

room prior to arriving. A special DCC room rate of $89/single and $89/double per night has been blocked for 50 rooms and is available until September 1st, 2000. Once the 50 rooms have been reserved, room

rates will increase. So be sure to book your rooms early! The hotel provides transportation to and from the Orlando International Airport.

Please contact the hotel to arrange specific transportation needs.

Orlando Airport Marriott (conference hotel)
7499 Augusta Drive
Orlando, FL 32822
Phone 407-851-9000, Fax 407-857-6211
(http://marriotthotels.com/MCOAP/)

What you can expect at DCC 2000
- A full day of papers and breakouts for the beginner to the advanced
- Two seminars/symposiums
- The fifth annual Student Paper session.
- A banquet with Special Guest Speaker.
- Informal get-togethers throughout the weekend.
- TAPR Membership Meeting
- An event at which the most important new developments in amateur digital communications are announced.
- Digital 'movers and shakers' from all over the world in attendance.

There are few activities where your participation can be so much fun and important! What a great way to share and renew your enthusiasm for

digital amateur radio! A get-together with colleagues and bringing each other up to date on your latest work -- all this, and more, for an unforgettable weekend of amateur radio and digital communications. We hope to see you at the ARRL and TAPR Digital Communications Conference on September 22-24, 2000!

Full information on the conference and hotel information can be obtained by contacting:

After all the posts about receiving NOAA images I'm a bit confused. What are the exact characteristics that make for a good receiver for this sort of work?

> band even NOAA Satellite Imagery ,I found that NOAA Satellite normally
> transmit - SSB Band with Frequency between 137-138MHz .

It's acutally FM at ~40kHz bandwidth, alas most radios have no more than
15kHz,
if it has 50kHz you'll be fine...

> 1. Does it(Yaseu) suitable for Recevice Satellite Imagery from NOAA?

As I could understand it did have a 30kHz, that might be good enough but
I can't really say..

> 2. Can I use the Qualifilar Helix Antenna and Yaseu to recevice

Don't see why that would be a problem

> 3. Also,Do I need more Accessories except Antenna and Recevice ?

Antenna cable :) and a computer with a soundcard and a decoding program.
http://www.hffax.de/WX_Satellite/WXSat/wxsat.html
is a great program for recieving pics. from weather satellites.
Actually there is alot of info on www.hffax.de , have a look at it

Sufficient IF bandwidth, mainly. The signals are somewhat wider
than the usual terrestrial communications stuff. But they're
not as wide as, say, FM broadcast. Look for 30 kHz minimum,
with 50 kHz being useful. One common trick is to use a really
cheap filter, since cheap filters have poor skirt selectivity
and act like they're wider than their rated bandwidth.

PLL demodulators are nice, since they can track Doppler while
they demodulate.

Frequency agility is not a big issue - here in North America
there are only four active APT frequencies (137.3, 137.5,
137.62 and 137.85 MHz).

If Arianespace had been more forthcoming with AMSAT, P3D would be in space already, But they chose to withhold valuable information until the last moment which forced us to miss our ride.

You need about a 30 kHz IF bandwidth to recover all of the audio. I've used my FT-50 set to "WFM", but it's a little too wide, and the pix look noisy. Some people take a regular scanner, remove the 455 kHz IF filter, and replace it with a .1 capacitor to "open up the bandwidth". I don't know how well this works, but there was a place selling "Specially modified scanners", and that's all he did.

Note that other satellites transmit in the same band. But the signals
are not very strong, so it will probably work OK as long as you don't
use Broadcast-FM-Stereo bandwidth...

Yes, I agree they should have been more forthcoming, and waited for us
to go up on the 502. But, as fate would have it, we now have a more
reliable bird to go up on. So, I guess it's all water under the bridge
now. Still, it's a rocket, so cross your fingers :)

Well, some detail would be nice. The ARRL antenna book and
handbook have very poor coverage of the topic really.

I constructed two dipoles with both have low SWR individually.
When connected together with a quarter wavelength of RG-6
the SWR is 2.5-3:1 though. I wasn't aware of the ground plane
requirement though, so that's probably the problem.

The impedance matching needs some thought (although you can also decide to
live with the mismatch, of course).

When the individual antennas have a low SWR, you will need an impedance
transformer when you parallel them. You should either:

- try to have each antenna double the impedance you need, then connect
them in parallel via a quarterwave section of coax of that impedance

or:

- have antenna impedances that are what you need, but connect them
together on a 2:1 impedance transformer

It is quite easy to make such impedance transformers for small bandwidths,
just take a quarter-wave section of coax of the impedance (mathematically)
midway between the impedances you have.
When you want to use commercially available coax and a 50 ohm system, it
is easier to transform up (via a section of 75 ohm) than down. So you can
transform both your dipoles up, then connect the resulting higher
impedances in parallel to get at 50 ohms again.

When you homebrew your coaxial line, it is also possible to connect the
dipoles in parallel and transform the too-low impedance up to 50 ohms.

Any antenna handbook explains this... look in the section about stacking
antennas, and about obtaining circular polarization from crossed yagis.

(what you are trying to build is in fact a 2x2-el crossed yagi)

After switching from an awe64 to Live player. (LiveWare 3) the pictures
are almost pitchblack
in wxsat, it's .wav recording seems to work if I open it in Satsignal.
All other decoding programs such as Wacars & Poc32 works just fine so it
has nothing to
do with the input signal strength but how wxsats interprets it.
Has anyone else this problem with wxsat or know a remedy to it?
I've tried to find an email to the creators of wxsat but cannot find
it..

//Ash

From my experience with the Live card the playback
and recording mixer sliders are very confusing.

When you run TEST from wxsat during a pass are
you getting a full waveform?

There's your problem: the phasing line should be RG-62, not RG-6. RG-62 is
100 ohm (93, actually), RG-6 is 75 ohms. And did you take the velocity factor
of the coax into account when cutting your 1/4 wave line?

The turnstile I built, with 3/8 wave spacing above the ground plane (4 feet by
4 feet, chicken wire over a wood frame), had an SWR of 1.2:1 and served me very
well on RS-10/11 and RS-15 for several years. I have since switched to an M2
eggbeater (less objectionable to the neighbors) and am very pleased with it.

Yes to all from what I understand. Plus HF eventually as well.
The 2m station SHOULD be on the air by spring 2001, that is if there
isn't more delays or problems.

I've read that eventually they'll have SSTV on almost continuously.

Success tonight! I have been listening for a few weeks trying to get a feel for how satellite communication works. (I did work an RS- a number of years ago, but it was not anywhere near as busy as this). I've been listening on an HT with a rubber duck, then I ordered an Arrow...got that yesterday (and boy, that anodized aluminum with the splatter pattern looks cool!) and listened to last nights pass. I heard the whole pass finally, but still didn't get a sense of order...it seemed a bit chaotic, and I thought it might be a case where he (or she!) with the most power wins, so I didn't bother trying last night. Tonight the pass was clear again, and it sounded a little smoother. I was out in the dark front yard alone, HT in one hand, antenna in the other, mosquitoes landing everywhere else! I decided to throw out my call, and low and behold, I GOT IN! Rich in Maryland and Steve in Canada (Toronto?) came back to get me! My adrenaline surged, and shortly after the pass I forgot everyone's complete call sign and grid sqare. I couldn't write anything down while out there alone, I wasn't even planning on making a contact...I should have grabbed a tape recorder. Rich and Steve, are you guys on here? Fill me in! If not, I'll catch them on a pass in the near future. Sure was exciting; I'll be back! (I heard someone say there was a pileup for me (probably new meat!), then I lost the satellite. :)

Because there is no significant probability of a free launch from either in the forseeable future for a satellite as big as Phase 3D. There are almost certainly things going on behind the scenes, but, despite the (very real) difficulties, ESA still looks like our best bet. If you have contacts at NASA or Glavkosmos, by all means, see what you can arrange!

Re-qualifying a satellite for a new launch vehicle is non-trivial. Phase 3D is ready to go on Ariane 5; if a Proton or Titan 4 launch were to become available, it would be back to square one on many things.

> my problem.

There are actually two issues here. First, you want to feed to
antennas in parallel for a net feedpoint impedance of 50 ohms.
This means that, somehow, each feedline must present an impedance
of 100 ohms.

My setup at home uses crossed dipoles (no ground plane) -
figure on a nominal dipole impedance of 50 ohms. Use 1/4
lambda sections of RG-59 (75 ohms) to transform this to
100 ohms. One feedline must be 1/4 lambda longer for circular
polarization, so use RG-62 (92 ohms) for the purpose. Tie
both feeds together for a net feedpoint impedance of 50 ohms.
I used nominal values for velocity factor out of the ARRL
Handbook.

The feed setup is directly out of the satellite antennas
section of Davidoff. He presents several near-recipes for
antennas, and this is indeed one of them. Have a look.

There is nothing sacred about any of this, and since it's
receive-only (137 MHz weather satellites), I haven't a clue
what the SWR is. But I get strong signals and decent pictures,
so I don't care.

> up the the zenith.

There's your answer! 3/8 lambda is common, because it gives a
favourable pattern. Depending on your exact needs, you may want
to sacrifice some high-elevation gain (which you don't need
anyway, due to the smaller range to the satellite) in favour of
low-elevation gain, where you really do need it.

The Handbook does use 70 ohm line, but that is for single pair of
crossed elements. If you use them over a reflector, then use the 90 ohm
stuff. Also if being used for the sats you need to pay attention to
either right or left hand polorization.

The RG prefix on the coax now does not mean too much except maybe for
the outer shield/jacket size. To get the true Velocity factor use
either the specs for the maker of the brand oc coax you are using or
measuer them.

I thought the recommended bandwidth was 40 khz. Anyway, Hamtronics carries a real nice little weather satellite receiver (I got one used for about $125) that works just great. I used it with omnidirectional eggbeater antennas and got good results, even on passes that were as low as 20-30 degrees elevation, at maximum. I think this is because the NOAA polar orbiters put out about 5 watts, which is a lot of power for an LEO.

Good luck and 73 de Bernie, KF0QS

Well, the antenna book says to use 75 ohm coax, and yes I did use
a velocity factor (of 0.75). It doesn't really give any hints on
tuning the thing up, but I figured that tuning the dipoles individually
for low SWR was the best place to start. (Otherwise there's too
many variables: dipole 1 length, dipole 2 length, and phasing line
length).

There's another pet peeve of mine -- the ARRL handbook lists RG-6
as VF = 0.75, but July's QST says RG-6 (with a particular Belden catalog
number) has VF = 0.66. I don't see how RG-6 can differ in velocity
factor -- any change would seem to make it something other than RG-6 !

I have some RG-62, so I'll try that as well.

Thanks all,
Hamish

> of the coax into account when cutting your 1/4 wave line?

OK, taking all the answers I've received here into consideration,
I'm even more confused :-)

I have two dipoles with low SWR. When resonant, they should have
feedpoint impedance of about 75 ohms (at half a wavelength above
ground). LB Cebik's excellent web site says to use 75 ohm (actually 72
ohm) coax for the phasing line, and 50 ohms for the feedline.

Does your RG-62/100 ohm answer apply for 3/4 wavelengths above ground,
rather than 1/2 wavelength?

So I used 75 ohm RG-6 (which seems to fit LB's instructions) and
the SWR is bad. However, I didn't test it 1/2 lambda above a ground plane,
and the SWR did seem highly dependent on the height, so that's probably
my problem.

Looking at some plots of antenna gain, for 3/4 lambda spacing there
are -30dB nulls at 45 degrees which look a bit nasty. 1/2 lambda
drops off above about 60 degrees (still +ve gain). 3/8 spacing
is quite interesting; gain is positive above about 20 degrees, right
up the the zenith.

Hello all!

I just got my call and I am very interested in working satellites.
3 day ago I received the license from the FCC...KD5KZN

I don't even have a radio yet, as I am trying to find a decent one to start
with.
since I all ready have an ICOM IC-r10 receiver, can I get a Yeasu FT-1500 to
work satellites with?

Any one have any suggestions? I am wide open.

Thanks,

Scott

An alternate way to do this is to fix the two 75 ohm sections
to the Tee, connect one directly to one dipole, and the other
to a 1/4-wave length of RG58 which then connects to the
other dipole. This avoids having to hunt up RG-62, which
isn't something most hams have lying around.

Does this mean you have it close to the real ground? With any
more than about a wavelength of height above ground (real ground
or ground plane) the pattern seems to be pretty ugly.

>>figure on a nominal dipole impedance of 50 ohms. Use 1/4
>>lambda sections of RG-59 (75 ohms) to transform this to

>>Handbook.

So you split the feed into two identical lengths of coax,
one of 75 ohms and one of 92 ohms, and rely on the Z difference
(or more likely VF difference?) to add the 1/4 wavelength?

Sorry to keep asking dumb questions but I just can't visualise it.
The description in the ARRL antenna book is IMHO not very good.

That much I can understand. Fortunately I already have some
RG-62 (it was surprisingly easy to find here in Melbourne).

thanks,
Hamish

Cash4Surfing

I found this on a bulletin board and decided to try it. A little while back,I was browsing through newsgroups, just like you are now, and came across an
article similar to this that said you could make thousands of dollars within
weeks with only an initial investment of $6.00! So I thought, "Yeah right,
this must be a scam", but like most of us, I was curious, so I kept reading.
Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups.
(There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured,

"What
have I got to lose except 6 stamps and $6.00, right? "Then I invested the
measly $6.00. Well GUESS WHAT!?...Within 7 days, I started getting money

in the mail! I was shocked! I figured it would end soon, but the money just
kept coming in. In my first week, I made about $25.00. By the end of the

second week, I had made a total of over $1000.00! In the third week, I had
over $10,000.00 and it's still growing. This is now my fourth week, I have
made a total of just over $42,000.00, and it's still coming in rapidly.
Let me tell you how this works and most importantly, WHY it works.
Also, make sure you print a copy of this article NOW, so you can get the

information off of it as you need it. I promise you that if you follow the
directions exactly, that you will start making more money than you thought
possible by doing something so easy! Suggestion: Read this entire message

carefully! (Print it out or download it.) Follow the simple directions and
watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (plus postage)

IMPORTANT: This is not a rip-off, it is not indecent,
it is not illegal, and it is 99% no risk - it really works! If all of the
following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE: please follow these directions EXACTLY, and
$50,000.00 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You
will
now become part of the Mail Order business. In this business, your product
is
not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to for quality
lists.
However, the money made from the Mailing lists is secondary to the income
which
is made from People like you and me asking to
be included in that list. Here are the 3 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write your name and address plus the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING

LIST."
Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent (thievery).
Next, place one paper in each of the envelopes and seal them. You should

now have 6 sealed envelopes, each with a piece of paper stating the above
phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all.
So
I
checked it out with the U.S. Post Office 1-800-725-2161) and they confirmed that it is indeed legal.

Mail the 6 envelopes to the following address:

1. Julius Tausaga, 2006 A.Fern St. Honolulu, Hawaii 96826
2. Steve Dixon PO box 511 Fairview NC 28730
3. Dan Polzin 7409 Wallingford St. Louis Mo 63121
4. Richard East 356 Grove Ln, Murray, Kentucky 42071
5. Jack Dukeshire 2 Army St, Randolph, MA, 02368
6. Bradley McMillan, RR#4, Winchester, ON, Canada, 12541

STEP 2: Now take the #1 name off the list that you see above, move The other names up (6 becomes 5, 5 becomes 4, etc.) and Add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money YOU make! You won't get very much unless you post like crazy. This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of

integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be

receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now,
add
your own name to the list and you're in business!

---DIRECTIONS----FOR HOW TO POST TO NEWSGROUPS---------
Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter, drag your
cursor to the bottom of this document, and select 'copy' from the edit menu.
This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of the
blank page. From the 'edit' menu select 'paste'. This will paste a copy of
the letter into notepad so that you can add your name to the list.
Step 3) Save your new notepad file as a .txt file. If you want to do your
postings in different settings, you'll always have this file to go back to.
Step 4) Use Netscape or Internet explorer and try searching For various newsgroups (on-line forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new message
by
highlighting the text of this letter and selecting paste from the edit menu.
Fill in the Subject, which will be the header that everyone sees as they

Scroll through the list of postings, in a particular group. Click the post
message button. You're done with your first one!
Congratulations. THAT'S IT! All you have to do is Jump to different newsgroups and post away. After you get the hang of it, it will take about
30 seconds for each newsgroup! (There is a faster way. You may use Microsoft
Outlook or Outlook Express to select newsgroups rapidly. You just need one
time "Copy and Paste" to send to all of them simultaneously.)
**REMEMBER,
THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT: YOU HAVE
TO POST A MINIMUM OF 200** That's it! You will Begin receiving money from
around the world within days! You may eventually want to rent a P.O. Box

due
to the large amount of mail you will receive. If you wish to stay
anonymous,
you can invent a name to use, as long as the postman will deliver it.
**JUST
MAKE SURE ALL THE ADDRESSES ARE CORRECT. **Now, each of the 5 persons
who
just sent me $1.00 make the MINIMUM 200 postings, each with my name at
#5
and only 5 persons respond to each of the original 5, that is another
$25.00
for me, now those 25 each make 200 MINIMUM posts with my name at #4 and
only
5 replies each, I will bring in an additional $125.00! Now, those 125
persons turn around and post the MINIMUM 200 with my name at #3 and
only

receive 5 replies each, I will make an additional $625.00! OK, now here
is
the fun part, each of those 625 persons post a MINIMUM 200 letters with
my
name at #2 and they each only receive 5 replies, that just made me
$3,125.00!!!Those 3,125 persons will all deliver this message to 200
newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react I will receive $15,625.00! With an original investment of only
$6.00!
AMAZING! When your name is no longer on the list, you just take the
latest
postings in the newsgroups, and send out another $6.00 to names on the
list,
putting your name at number 6 again. And start posting again. The thing
to
remember is: do you realize that thousands of people all over the world
are
joining the Internet and reading these articles everyday? JUST LIKE YOU
are
now! So, can you afford $6.00 and see if it really works? I think so...
People have said, "What if the plan is played out and no one sends you
the
money? So what! What are the chances of that happening when there are
tons
of new honest users and new honest people who are joining the internet
and
newsgroups everyday and are willing to give it a try? Estimates are at
20,000 to 50,000 new users, everyday, with thousands of those joining
the
actual Internet. REMEMBER, play FAIRLY and HONESTLY and this will
really

work. The possibilities can be endless...You will never know, unless
you

give it a try... otherwise, it will always be "what if."
GOOD LUCK!

YOU'RE PAYING TOO MUCH FOR THE INTERNET!

Hello all,
One simple question: Is RG-62 coax the same they use in common car antenna?.

I am making a eggbeater antenna, but can't find RG-62 locally.

Tnx, Edgar. HI8PLE.

Thanks Tom, I appreciate your feedback. Once a sufficient test period is
completed and I've worked the 'bugs' out, it will become an "official"
channel on AvantGo. When that happens you will have to re-subscribe but
I'll notify everyone of the change when it occurs.

Yes. It should be.

When I bought RG-62 for my antennas I asked what the intended use
of this coax was, and they told me it was for car radios.

It's also used to connect IBM 3270 computer terminals. Until recently I had several hundred feet of it that I pulled out of my office when we upgraded to an AS/400 system with twinax.

My turnstile had one dipole fed directly with RG-8X, and a 1/4 wave phasing/matching line of RG-62 to the other dipole. Radiators were mounted 3/8 wavelength above a 4x4 foot reflector of window screen over a wooden frame. SWR was 1.2:1 at 145.85, and I used it on RS-11 and RS-15 for several years. Finally retired it and bought an M2 eggbeater with radial kit, for a lower-profile installation. Performance is very comparable.

Here's my thinking; tell me where I go wrong. At 3/8 lambda above ground, the impedance is about 100 ohms. Therefore, two in parallel are about 50 ohms. I will use 50 ohm feed, split into two 100 ohm feeds (RG-62 93 ohms; close enough), one of 1/4 wave longer than the other.

Is this correct? I don't think it quite matches your diagram, so perhaps not.

I bought the Davidoff today and will study it thoroughly!

Thanks,
Hamish

> feeds (RG-62 93 ohms; close enough), one of 1/4 wave longer than
> the other.

Diagramatically:

```
---+--- ---+--- <--- 2 dipoles, 100 ohms impedance
| |
| | <--- both feedlines RG-62 (92 ohms)
| | any length
| |
+-----------+
| ^
| |
| +---------------- RG-62 phasing line (92 ohms)
| 1/4 lambda long
|
| <------------------- 50 ohm feed to radio
|
|
```

The two lines after the split are of any length but different
by 1/4 wavelength. In this case they are not being used as
quarter wave matching lines as they were in your diagram.

Thanks,
Hamish

Thats it...I've had enough !!!!

After tracking sats, talking with peopkle worldwide for many years etc etc etc, and being (like you) involved in many hobbys that are time zone dependant, I really need to know who the complete idiots are that insist on making up new bloody time zones for those that already exist !!,
IE. GMT-UTC-WET etc etc etc...

I mean WET... who come up with that stupid idea !.
I have now totally lost count of how many there are now because of people sodding about with what has been established for many many years. Not to mention it causes havoc when I read something and someone puts some (slang) in there for something else because i have to waste time looking it up.

It's almost as bad as those radio operators who insist on changine long established phonetics.

I mean , Gonad, Banana, Teakettle, catsbum really does not make low signal strength qso's easy now does it ?. especially when we are all used to the standard.

Please stop polluting times, phonetics, morse and just about every other well established system that WE ALL know and that makes life easier in the end !!

I'm going mad here....Arrrggghhhh !!

ian

The problem with this is that your dipoles will not be 100 ohms, unless you
use folded dipoles with the correct ratio between the straight element and
the foldback ends.

An open dipole in free space is something like 73 ohms, and putting it
near a reflector will only reduce the impedance. That is why a design
that assumes 50 ohms for the dipole can work, if the dimensions are right.

On the Continent the standard practice has been to talk about Western
European, Central European and Eastern European time (in various
languages), so it is quite natural to talk about WET, CET and EET time
zones. Unfortunately the daylight saving time idiocy has complicated
the situation.

UTC, UTC+1, UTC+2 has been used mainly in radio communication, but not
in normal civil activities.

To be pedantic, what is GMT (Greenwich _Mean_ Time) ? It is the time since the fictive mean Sun transit of the meridian in Greenwich. While in other time systems, the date changes at midnight, but in systems based on the mean Sun, the date changes at noon :-), or looking it the other way, there is a 12 hour difference between GMT and UTC. If you are so attached to the name of a London suburb, call it at least Greenwich Civil Time, which would be equivalent to UTC.

>Thanks, Sam alphacentauri@i-plus.net
>
Please bear with me as I am more than a little confussed by your questions.
WXSat runs on your PC, it uses the AUDIO from your receiver, into the LINE IN
[Microphone in has too much gain]. Run a line from your speaker/earphone/tape
out on your receiver/scanner to the line in on the sound card.
You should not need a data line to the receiver [unless it is like the Icom
PCR1000 and shuts off unless kept active by the PC].
So to recap, antenna to receiver, audio output to PC soundcard line in.
[on PC 1/8" 3.5mm connectors the tip is LEFT the ring is right and the sleeve
is ground]
You may wish to buil an attenuator to go between the speaker output and line
in, some sound cards choke on the background noise even with the receiver
Voume control at minimum. Most sound crds will work fine with just a patch
cable. An attenuator is real simple, for speaker to line matching I use
10 ohms 1 watt accross the output from the reciever, then I connect the
grounds, and use a 10K 1/8W series resistor with a 1K in parallel with the
sound card input. Most [all of mine] radio application use the LEft/tip so I
use mono 1/8" jacks.
I hope this all makes sense and good luck watching the images!

I think we should drop all zones, put everyone on GMT, and just live with
the fact that in one country the sun rises at other times than in another.

Wouldn't it be easier to have one time zone for the whole world - that and
the 24 hour clock would make itclear for all....

It's full duplex, you can check it yourself. If alot of stations are on
the uplink, it might distort your tones.

Maybe you're thinking of Galway Mean Time, but Greenwich Mean
Time is no more than 750ms different from UTC, and kept there by
the use of leap seconds to maintain UTC close to astronomical time.

Yes, GMT does (did?) take the mean transit of the Sun over the Prime
Meridian, but that instant is defined as noon and not as midnight in GMT.

There are virtually no logging requirements except as a station
wishes to maintain as a defensive measure to show who was not
operating and in regards to Spread Spectrum, in order to allow
the FCC to demodulate such transmissions.

And the FCC has no rules on the time standard to be used in
a station's records.

>The same as CET. UTC replaced GMT long ago.

Although it would be better if it was equal to UTC... Here in the
Netherlands, we clearly are in Western Europe. But we are on Central
Europe's timezone. As a result, our wallclock time is always 40 minutes
ahead of sun time, and when DST is in effect is is even 1:40 ahead!

In the summer, the sun is at its highest point at 13:40 and it does not
start to get dark until 21:30-22:00...

But again, it would be far less confusing when everyone went to UTC and
just did not assign any special significance to clock time relative to
sun time. As others mentioned, it would also lessen the confusion about
the date. How nice when the date is the same everywhere around the world!

NO, the bloddy Eurocrats have tried their best to force UTC over GMT but like the pund/Euro they can get stuffed, did you know that some complete pillock even wanted the meridian line moved to go through germany or was it france can't remember ?.

Arghhhhhhhhhhh i'm off one again :-)

GMT has been established for centuries, it WORKS so why change it, the only change I DO agree with is getting rid off BST changes because the reason for introducing them went out after the damm WAR !.

Hi Steve
I believe Heavens above only gives "visible" passes not "radio" passes.
Winorbit is a good program to start you own tracking.
I make up a book of passes for a week ahead and carry it with me.
UO 14 AO 27 & SO35 passes last about 14 minutes edge to edge, here in
Ontario
I get to use about 10 min of that. That is the Sat is too low for the
first two min and last two min.

It might sound a little stupid but isn't that what millions of night
shift workers do anyway!

BTW Chambers dictionary describes Morning and Night as first and end
parts of the day (respectively) - so for a night shift worker is my
morning the equivalent of his night?

I'm not sure what the fuss is about - we need an absolute reference
time (and forgetting the nano-seconds or whatever difference between
UTC and GMT standards) what does it matter if we call it GMT, UTZ or
Zulu (I use the latter as Z is 2 less letters to add to my QSL
labels).

I never remember any other timezone acronyms just that its 5 hours to
New York, 8 to San Francisco (except for the 2 weeks where the clock
changes re out of synch) and that you have to turn your analog watch
upside down for the time in New Dehli!!

Well, modelling tools disagree. Of course, modelling tools aren't
everything but they shouldn't choke on the humble dipole. At a 1/2 wavelength
above ground, the impedance is about 73 ohms, but (according to these
tools anyway) the impedance at 3/8 wavelength above ground is about 100
ohms, which is what I'm using.

Actually, at 4/10 wavelengths or thereabouts, the pattern is a bit better
(favours low angles a bit more) and the impedance is about 93 ohms --
sounds perfect.

I am just getting into working satellites and have been having limited luck with a dual band 2m/70cm high gain vertical that is up on my HF tower. I was thinking of putting up a log periodic vhf/uhf on top of my HF beam at 50 feet and was wondering if it would be worth the effort? I realize that to do satellites seriously you need a azimuth/elevation antenna setup but at this time budget and space will not allow that. I am having fun with the vertical but it would be nice if a beam would increase that fun and be worth the cost.

Any info would be appreciated.

What a stupid idea!

People all over the world over know that their normal "retiring" time
is somewhere between ten and twelve pm, take lunch between midday (12)
and two pm, and that their normal "getting up" time is somewhere
between seven and nine am - and know that it will be a new day of the
week and a new date when they wake up.

Consider what would happen if this crazy idea was adopted. The first
thing you would need to ask would be "what time of the day do you go
to bed around here?" Could get a slap around the face for that.

Don't trust your memory, it's actually 5 hours to New York except for one
week in Spring starting on the last Sunday in March when it's six hours.

There are all kinds of tracking programs at www.amsat.org -
have a look, download some, play with them!

I usually use sattrack, which has the usual Mission Control-
style ground track display, the usual prediction facilities,
and has functions to answer questions of the form "when is the
next analog/digital/weather/whatever satellite due?" If you
want something small and slick, consider predict.

You will need regular updates of orbital data (I update once
a week - YMMV). I get mine from www.celestrak.com.

Hi Sam

Somewhere in your Yaesu FT 8100 manual should be instructions to set the step to 5 khz. I looked on the Yaesu web site and listed in the specs, the available steps are : 5khz, 10khz, 12.5khz, 15khz, 20khz, 25 khz, & 50khz

The high gain vertical does not work well because it achieves its high gain
by bundling the energy towards the horizon. It does not radiate or receive
much above a few degrees elevation.

Use a low gain antenna and this problem will be much less apparent. The
signal is less but it remains there when the satellite climbs higher.

There are many suitable antennas, and you can see them discussed on this
group.

Sam, the 8100 absolutely will tune in 5khz steps. You'll have to change the default step from the 25khz norm for UHF, but it will go there, just start about 10khz high at the beginning of the pass and be at freq at the middle and about 10khz low at the end to account for doppler.

On 2mtrs, you'll only need +-5 from one end to the other and it goes in the opposite direction, start low and turn high.

People do it with HT's all the time. Heck I've talked to someone mobile on SO-35 already and they were just using the 2m/70cm vertical whip on the car.

There are 3 FM voice sats currently. AO-27 (it's getting new software and may be down currently also, only on during daylight passes, nothing at night), SO-35, it's on a schedule with data and voice passes, you'll have to find their webpage for the schedule of times and modes, and UO-14 which is only in FM voice mode.

All of these are Mode J sats (2m - up/70cm - down).

Hope this helps.

www.heavens-above.com WILL not only give passes for the next few days but will give Weeks or month . Just select a sat from there database and enter the sats name(Oscar 14). Then click Submit. Click on the sats name and then click passes in the up right hand corner. Then click NEXT in the up right hand corner for more ! It will tell you the pass info no matter what the weather may be like ! Good luck ! Sam, alphacentauri@i-plus.net

What is the differance between 'visible' and 'radio' passes ? There may
be some bending of the VHF signals, but would not think the programs
take that into their calculations.

If you want to go to a beam, you will have to do the az/el unless you mount the antenna at about a 45 deg angle to the ground. A low gain beam (around 3 elements) mounted like that will work to some extent. YOu will get a broad pattern and will have to track the sat with the rotator. As height does not mater too much, you may be able to find some rotators of the U-100 class for $ 15 or so used. by modifying one by breaking out the stop for the mask you can pass a pipe through it and mount it so that it is an elevation rotator.

YOu might try a Turnstile over a reflector . This is a set of crossed dipoles over a reflector and phased correctly. This puts most of the signal in a broad upward patern instead of the patern the antenna you are using does. The one you have puts out a small amount much above the 20 or 30 degree point and most below that. You need ot do the oposit, more up and less out.

www.heavens-above.com is more than what people think. I have ben
able to find out the passes for my area starting today through
16 october 2001 (ye! 2001!). Even if it says there are no
visible passes, keep clicking next and it will keep searching
in ten day periods . Heavens above says that Oscar 14 has two
alternate names, UOSAT 3 and UO-14 .

>take that into their calculations.

No... a 'visible' pass is a pass where the observer is in darkness and the
satellite is in the sunlight. This is for use by people who like to
observe the satellites as "moving stars" along the evening sky, not for
radio amateurs who listen to the signals. Probably most website visitors
are the visual observers.
(some satellites are very bright when observed visually)

Maybe the modern modelling programs have better data than old "rule of
thumb" antenna books... just give it a try!

It used to be like that here until about a decade, but then the idea
of a "24 hour economy" started to take off, and you find that there are
less and less "standard times" for doing things.
Shops open longer and longer, people try to negotiate ever more flexible
working hours to avoid traffic peaks, etc etc.

I think this already happened in the USA long ago, so that "all over the
world" area where the times you mention above are valid should probably
be limited a bit.

(and now I am not even talking about the notion of AM/PM on clocks, that
idea has been abandoned in favour of a 00:00-23:59 clock long ago here)

I'm trying to hear UO-14 using an HT with a 2m/440 whip antenna (1/4 on 2m, 1/2 on whip, I think). I'm not having any luck. Should I be able to pick up this satellite using the setup I've got?

Thanks,
Rodney - KF4COV

Actually:

GMT is *not* the same as UTC or even UT1 or UT2, but *you* wouldn't notice
the difference.

Up to the latter part of the 19th century, each country had it's own
meridian, generally passing through its own capital - Spain (Madrid) and
France (Paris) were but two.

It was one of the earlier actions of the IMO (International Maritime
Organisation) that sorted that out and chose the Greenwich meridian as the
Prime as the UK was the premier maritime nation at the time.

: nothing to do with it ?.

Quoting sorted (again!).

Before the latter part of the 19th Century, the British 000 longitude ran
through Greenwich, the Spanish 000 longitude ran through Madrid, the both
ran through the geographic poles.

If you go to Grand Canaria, there is a Maritime Museum with some 1880's
charts of the the island. It took me some time to twig that the island was
not at ~012 deg W - and this lead me to research the issue. As I said in a
previous post, it wan't to the early 1900's that most (all?) nations came
into "line" :-)

Easily. Verify your pass times, and make sure you've got the
frequencies (inlcluding Doppler) right.

I've just learned, from another newsgroup, that chip-shops in
Inverness open at 4 a.m. to cater for the traffic coming out
of the clubs.

But for communicating across time zones, you obviously need
a common time-reference. UTC serves this purpose adequately.

>for practical use...

Quite so. Our National Time & Frequency standard at the NPL is derived from
a ceasium clock. So our standard time is UTC.

The NPL is in somewhere called Sussex, not at Greenwich, so GMT has long
been a redundant standard.

>In my experience, people use the expression 'GMT' as a synonym for UTC,
>since they don't know the difference between them.

Most of them don't even know the difference between UTC and BST, never mind
GMT. Let's not confuse them further.

My shack clock is locked to the 60 kHz MSF transmission, which in turn is
locked to the UK Primary Standard, and so indicates UTC, not GMT. (Actually
BST (A) at them moment, which is 1 hour ahead of UTC (Z).

Rare event indeed! Has anyone else on here worked Walt on a repeater ?

Taken from my "G8HQW" log book:

11/5/75 11.37-11.38 145.150 G3NYY/M F3 60w (Remarks Column=Walt)

Granted, it wasn't one of my longer QSOs and unlike our SSB contact in
June 76, I've no QSL card to prove it !

My Rig: Pye Vanguard with QQVO6/40 modified to use a pair of 2N3055s
in the invertor 'cos I blew the original PNP power transistors up!

My QTH: One of the tower blocks at G3UOE.

(Incidentally, G3NNY John, Luton was worked on 29/5/75 on 145.435MHz)

So its 73 agn OM de G4FZN

1913. ISS Frequencies

Hi Does anybody know the non ham frequencies that will be utilised by the ISS? Particularly interested in the downlink to Mission Control Moscow. Speculation says the Mir freqs. of 143.625/130.167 will be used but nothing I can find confirms this. With the first crew soon to go up it will be interesting to monitor developments. Hoping for some help. Regards Colin

1915. Wx Sat receivers

Newsgroup: rec.radio.amateur.space
Date: 2000-08-03 00:00:00 UTC
From: "Tom G." <tegwilym@wolfenet.com>
Message-ID: <8mdipggvh1@sparky.wolfe.net>
Source record: 8710

I recently discovered how easy it is supposed to be to receive images from the weather satellites in polar orbit. I have been looking around the internet to find out more about receivers to do that. It seems the best ones (most affordable at least!) are the Hamtronics and the Ramsey eletronics receivers. Both of them can be bought as a kit or assembled. I was wondering of anyone out there has built either one of these radios? I don't have a good signal generator or frequency counter and was wondering if these could be built without the use of those? I sent email to Ramsey Electronics and they told me that their kit could be built without the signal gen, and Hamtronics said that I would need good signal generator to do it.

Also, an antenna question. I figure I would attempt to build my own antenna (plans in the downloadable Ramsey kit manual) first and see if that would work out ok. I live in a condo and we all know how that goes with antennas! I do have a pretty large patio and was wondering if the antenna was about 6 feet up and maybe 6 feet from the side of the house if that would affect reception much?

Thanks!

They use the expression 'GMT', however, all civil timekeeping is based on UTC. UTC is directly related to the time kept by atomic clocks, and that makes
it fairly simple to maintain. GMT is related to the motion of the (fictitious) mean
Sun, and that is more cumbersome, particulary for navigation. I'm not aware of
anybody who actually measures time in GMT for practical use - certainly a broadcast station would not go to the trouble to use GMT to indicate something
distinct from UTC. In my experience, people use the expression 'GMT' as a synonym for UTC, since they don't know the difference between them.

The proposals were to move the line to Paris and adopt CET (Paris time;
it was proposed before the "Eurocrats", I think it might have been
Napoleon. Since most the world uses UTC (almost GMT) and a meridian line
which is almost the Greenwich line (it was defined in 1984). Don't
forget that the line moved every time will built a new telescope at
Greenwich.

So what! Clock time is an artefact of civilization, its less confusing if you tell someone that you will call them at 13:00. There would be no question of 'is that my time, your time, are they on summer time', there would still be the question of availability due to work and sleep hours. Unless of course you presume that people are too stupid to go to bed when it gets dark.

Europe and North America change together (well - within a few hours) on the
last Sunday in October.

First thanks for the answers to my question about using a no elevation variable beam for Satellites. So... now I'm considering a ground tripod with a 440 and 2m beam mounted on a azimuth and elevation rotor. My question is (I live in a heavily wooded area of NH) will the fact that I have limited lawn space surrounded by woods on 3 sides and the side of the house on the 4th make a ground mounted Sat antenna fairly useless for low elevation passes.

Thanks es 73

Hi,

After a few weeks of being on the birds, I think
I've figured this out.

It seems that some people, especially foreign ops,
use DTMF tones at the end of their transmission
(or maybe it is at the beginning, there are usually
pileups so it's hard to tell who's sending the tones)

Many HTs and other VHF/UHF rigs in the US are able to
use DTMF paging, so maybe that's what these people are
doing, sending out their tones so others know they're
there.

I could swear though, I also hear dial tones or other
telephone related signals at times! Not just from AO-27
but from UO-14 as well.

On the plus side, I worked the Azores from Boston with
50 watts up on 2M and my new antenna receiving on 436!

Now I've got a duplexer so working the sats should be easier!

Hi Steve,

Look like I was incorrect about Heavens Above, it says it is showing all passes for Amateur Sats. When I compare it for the next 24 hours at my location Belleville Ontario it gives 4 passes. Winorbit gives me 7.
I think Heavens above is only giving passes above a certain elevation angle. The omitted passes appear to be less than 10 deg. I will check to see if this parameter is adjustable.

Its about time all clocks on Earth told the same time. The
advantages even with international rail and air travel
timetables are obvious. There are others.

There's nothing whatsoever to lose by such standardisation.

Some nincompoops might say shopkeepers and publicans would
use the change as an excuse to put up the price of butter
and beer. But who takes any notice of nincompoops?

Reg.

GPS time is 13 seconds off from UTC... but you probably compensate for
that.

The following page confirms this: http://www.users.wineasy.se/svengrahn/
(look somewhere at "radio frequencies for manned spacecraft)

Of course you never know how much will go via that link, how much via a
link to TDRSes that undoubtedly is also available, and how much via both
ways.

Sure, but in a world where governments think that something can be gained
by setting the local clocks an hour backward and forward twice a year, it is
unlikely that such a big change (in the other direction) would ever be
made...

A friend bought, and I assembled, the Hamtronics WXSat receiver.
While a signal generator will help, you can do it with out one.
Especially if you have a scanner and HF radio.
Most older scanners use a 10.7MHz IF. To generate 137.N, program in
137.n +/-10.7MHz, listen on yet another scanner to find out if you need
to go plus or minus. Most scanners are more than stable enough to use.
The Hamtronics unit is crustal controled, so at worst case the LO is
only slightly away from the desired freq. USe a scanner to set the
LO roughly to frequency and then zero it on a good overhead pass.
I use IT and it will show the doppler offset, when the bird in nearly
overhead there is not dopplar and you can peak it right up.
It is early and I have not yet had my caffine, so reply if this makes no
sense.

1936. 435.070 Satellite?

Newsgroup: rec.radio.amateur.space
Date: 2000-08-04 00:00:00 UTC
From: sbcmusic@aol.com
Message-ID: <20000804111005.08250.00000677@nso-fq.aol.com>
Source record: 8720

Hi, all, I heard some local hams talking about receiving a satellite on 435.700, and they thought it was either a new satellite or one that had just been changed over from some other mode. Can anyone help me find info about it?

Thanks and 73,
N9GSU

JimD (dynastic@REMOVE_THIScwcom.net) wrote:

: Quite so. Our National Time & Frequency standard at the NPL is derived from
: a ceasium clock. So our standard time is UTC.

Right

: The NPL is in somewhere called Sussex, not at Greenwich, so GMT has long
: been a redundant standard.

Wrong, unless Teddington has been mooved to Sussex (or remotely more likely,
Sussex has grown to include Teddington). The "Observatory" part of Greenwich
has moved to Herstmonceaux (sp?) in Sussex. The "pips" generator and "That
Line" are still in Greenwich, along with that thing of greater national
interest (according to the Sun).

: >In my experience, people use the expression 'GMT' as a synonym for UTC,
: >since they don't know the difference between them.

: Most of them don't even know the difference between UTC and BST, never mind
: GMT. Let's not confuse them further.

Except that they can lay in bed longer for a day in March!

: My shack clock is locked to the 60 kHz MSF transmission, which in turn is
: locked to the UK Primary Standard, and so indicates UTC, not GMT. (Actually
: BST (A) at them moment, which is 1 hour ahead of UTC (Z).

Aha, but is your shack frequency standard locked to MSF - and that the clock
is locked to MSF will put you about 1 mSec slow of UT2.... :-)

The Royal Oberservatory was moved from Greenwich to Herstmonceux Castle,
and later the name was further relocated to Cambridge Univerity and finally the
RGO was closed. I believe that sole remaining Royal Obervatory is in Edinburgh.

The Pips are generated by the BBC, and I doubt that they do it in Greenwich.

There is only one UTC, and it is coordinated by BIPM, the International Bureau
of Weights and Measures, near Paris.

Hello Rick!

I think you probably heard me talking about UO-14 last night. In Muncie,
on 147.42 simplex between passes last night?

Anyway, you can find out more about this bird at:

http://oeonline.com/~kf8bex/uo-14.html

Vy 73 and hope to see you on the birds!

1947. Re: Wx Sat receivers

Newsgroup: rec.radio.amateur.space
Date: 2000-08-04 00:00:00 UTC
From: Ralph Mowery <rmowery@dialpoint.net>
Message-ID: <398B5363.962C0FED@dialpoint.net>
Source record: 8731

While you can build the receivers, you might want to look at a cheap scanner. While the IF frequency is normally too narrow for the sats, if you simply remove and by pass the 455 khz filter with a .01 uf capacitor, that will widen the If enough for the sats.

Antenna heigth is not too important to receiving the sats if you have a relative clear view to the sky. For sats in the 150 mhz and below range it will take either a lot of metal or a bunch of very dense trees. Higher frequencies and the trees will be somewhat of a problem.

I tried last night to listen with the same setup as below & couldn't hear a thing except static. Maybe I have some problem with my times in my satellite tracking program. Could someone confirm the evening pass over Huntsville, AL was from 1:19:29 until 1:27:47 UTC on 8/5/00 (8/4/00 local)?

Also, the next pass shows to be from 2:54:36 until 3:09:27 UTC on 8/5/00 (8/4/00 local) & is almost right overhead.

Thanks for the help,
Rodney - KF4COV

As Tony states, there is only one UTC. There are other forms of Universal Time (UT0, UT1, and UT2) that are used for various purposes, such as navigation. However, these measures of time have precise definitions that are distinct from UTC. UTC is based on atomic time and is maintained (through the use of leap seconds) to be within 0.90 seconds of UT1. UTC differs from atomic time by an integer number of seconds.

For those who are interested, UT1 is related to the actual orientation of the Earth relative to the stars. UT0 is the observed time at a particular location and must be corrected for polar motion to determine UT1. UT2 is determined by applying seasonal variations to UT1.

Of these 4 measures of time, UTC and UT1 are the most useful.

Tim

Hi folks,
Well I thought I'd give UO-14 a try this morning during the 1508
pass, FORGET IT. How the heck is someone supposed to work it with all
that insanity??? I thought you were supposed to make a contact or 2
and let others have a shot? The same guys were working the sat the
whole pass. There was no way I was getting into that bird. It's non
stop insanity, you don't stand much of a chance at all.

I hear it fine using an Icom W32a and a Diamond telescoping whip.

I thought AO-27 was bad....

Source record: 8740

Hi Rodney
Your times look OK to me.
Remember to back of the squelch completely, and if possible wear
headphones or an earpiece.
UO 14 is southbound at night so you should orient your duck in an EW
position
so the signal is hitting it from the side. Sometimes angling it at 45
deg. or so away from you body helps.
You should start listening on 435.075 and then adjust for doppler as the
pass progresses.

435.075 start of pass
435.070 middle of pass
435.065 " "
435.060 end of pass

I am east of you and my passes for 6 August are 00:49 - 01:01 UTC
02:27 - 02:34 UTC
04:08 - 04:20 UTC
Your passes will be a couple of minutes later, if you start with my
times you should hear it
coming towards you.

Hope to hear you soon

73

Seeing how either the Euro laws are stupid and over the top, or Yaseu dropped a big gonad it seems we cannot use/purchase their AZ-EL rotors legally in the UK ?.

What are the other options to this unusable overpriced rotor /

thanks

ian

1959. Ralph Nader 2000

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine

sticker (17K) or a Banner ad (5K):

==========

What it Means to be Green

"At the root of all Green political action is nonviolence, starting with how we live our lives, taking small, unilateral steps toward peace in everything we do. Green politics requires us to be both tender and subversive. Affirming tenderness as a political value is already subversive. In Green politics, we practice tenderness in relations with others; in caring for ideas, art, language, and culture; and in cherishing and protecting the Earth. To think Green is to build solidarity with those working for social justice and human rights everywhere, not bound by ideologies."

-Petra Kelly

BBC time is generated from GPS time signals - the receiving aerials are
just underneath the G8BBC rotator stack on the top of Broadcasting House !

Someone on this newsgroup did enquire about the system a few months ago,
but the "Time Lord" regenerated in the meantime, and it's taking a long
while to find out just "Who" it currently is !

I believe that GPS feeds both NICAM and RDS, but I have no idea where the
PIP service is located in these networks. And as they now own the PIPs, the
Beeb is free to call it GMT or AuntieTime or whatever the daft old foggies care.

I'd guess that it was the Empire-loyal foggies in Bush House who clung most
tightly to the use of that plainly wrong name.

Then why is RDS so inaccurate? You can listen to the pips then
look for the RDS time to change. Often up to 5 seconds later.

Comparing MSF time with the time you get by pressing the 'Time'
button on your remote control is also inaccurate. Is that NICAM
derived?

>And as they now own the PIPs, the
>Beeb is free to call it GMT or AuntieTime or whatever the daft old foggies care.

I understand the pips are locked to the UK Primary Standard at the
NPL (in a place called Sussex). The standard is based on the radioactive
decay of Caesium.

>tightly to the use of that plainly wrong name.

To what empire do they claim loyalty? There's only Scotland, Wales, part
of Ireland, Gibraltar and the Falklands left.

I'm not aware of a provision for time information to be inserted
into NICAM (audio) data streams, if anyone does know differently,
please shout.

"Teletext Time" can be affected by the data bridges used to insert
'regional' teletext pages in local regions and networks.

Looking just now at analogue signals from Crystal Palace, BBC networks
are pretty close to MSF, whilst 'the others' are up to 3 seconds off.

> I understand the pips are locked to the UK Primary Standard at the

I think the primary standard is located at Teddington - IIRC there was
an article somewhere about how they did the error comparison of the Rugby
clock, it seemed to involve making use of the Vertical Sync Period in
the BBC 1 transmission from Sandy Heath as a common reference seen by
both.

I'm not sure about the 'radioactive decay' bit - I thought they got the
atoms 'excited' and then used their natural frequency of vibration.
Certainly the old Rubidium oscillators we had at work took their time
in warming up, and if they hadn't been used in quite a while, forgot
how to perform !

There is a "standard"' way of indicating what might be described as "universal
date", that is Modified Julian Day or MJD. For example, 7 August 2000 is
MJD 2451763; the first 2 digits are usually deleted, making it 51763. The
advantages of using MJD are;

* UTC is implicit, hence there is no date confusion due to time zones.
* There is only one way of writing a date. (Is 7/8/2000 the 7th of August
or the 8th of July? etc).
* Each day has a unique number.
* Date calculations become simple because of the single number base (indeed
the original "Julian Date" system devised in the 16th century was to allow
conversions between different calendars).
* An MJD can be extended to pinpoint any time by decimalising the fraction
of a day and adding to the MJD, eg 2:30 on the day used in the above
example would be 51763.10417.

Have a look at http://www.whatis.com/julianda.htm for more information on
Julian date (or Julian day number).

That is the original Julian Day Number (JD or JDN) counting days since
12:00 UTC Jan 1, 4713 BC, thus, the day number changes at 12:00 UTC.

>the first 2 digits are usually deleted, making it 51763. The
>advantages of using MJD are;

The modified day number (MJD) is the number of days since 00:00 UTC
Nov 17, 1858 (which is JD 2400 000.5) and thus, MJD changes at 00:00
UTC). This, it would appear as the first two digits are deleted, but
there is also the important 12:00 hour (0.5 JD) difference in the way
days are counted. The MJD was originally invented for computers with
limited word length and was selected in such a way that none (or at
least extremely few) would have a negative MJD birth date when the
system was implemented.

If you discount the propogation delay, MSF time is quite accurate, <1mSec.

: I understand the pips are locked to the UK Primary Standard at the
: NPL (in a place called Sussex). The standard is based on the radioactive
: decay of Caesium.

(Most of) The National Physical Laboratory is at Teddington, which is quite some distance from Sussex. The Caesium standard is based not on the radioactive decay but on the transition tine between two hyperfine levels of excitation of the Caesium atom.

The Caesium standard is the Internationally defined standard of frequency and time. Individual Caesium standards are "primary" (mine is as good as yours) but vary in terms of parts in 10^-14 (errors measured in terms of seconds per million years).

Rubidium oscillators are not primary standards - they rely on the Rb gas
cell pressure which has a tiny but consistant effect on frequency.

In the US, it was popular to use a couple of old Allaince U-100 or U-110 rotors. These were the type the antenna mast passed through the center verses mounting on top. They ocasion show up on the news groups, HamFest, and E-Bay.

Ok this is whats happening, I have this Cushcraft 13b2 for a year now and out of the blue my landlord wants me to take it down. First he wanted verification that I was licensed to have Quote such a antenna structure, 13b2 on a 15foot mast which is very secure, the mast is bolted with 5 clamps to 4foot wall with 6inch screws. Anyway I sent all my paperwork next day air, rules regs everything after he said thats all I needed everything would be ok. Now 4 days after I called and says I still can't keep it "because its to big and too "highup" and doesn't want the liablity if it falls. their are at least 17 antennas up there 5 of which are standard tv antennas. The quote of the day is he's F$%&ing with me. And I can't afford lawyers or expensive circular polorized antennas So, Im willing to give up my cushcraft 13b2 in hopes to trade towards a used arrow antenna which I will adapt for rear end mounting, if anyone has such an antenna stored away that they don't use Im open. please contact me at my email : wb2rxf@yahoo.com

Radio Meteor Observation Bulletin No. 84 August 2000

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Paseo Bonanova, 8 Barcelona (02 07'E, 41 24' N)
Frequency: 48.24715 MHz.
Transmitter Location: Biedenkopf C2 TV, Video Frequency 48.250 MHz,
ERP 100 kW, Azimuth 90 +/-65
Antenna: Six element Yagi 617-6B, 14 dBi gain, horizontal polariz.
Azimuth 200 deg (NE), elevation 20 deg
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (500 Hz) and fed into the PC in real time.
Data sampling system: own written software "MSD" with sound card.

| July 2000
```

Note:
. ? probably affected by sporadic-E or FAI
. had to take down the antenna on July 14th as construction works are
carried out during the holidays in the building.

Enric Fraile Algeciras

Observer: Michael Boschat
Location: Halifax, Canada (63 36'W, 44 39'N, 58 meters above sea level)
Listening Frequency: 83.24 MHz
Receiver: Icom R-10
Antenna : resonant dipole
Antenna Direction: Horizontally polarized with lobes in E-W plane, elev 0 deg
Filter : high-Q (Q at least 300) bandpass filter between antenna & receiver.
Listening Mode: CW
Recording method: listening by ear

Notes:
. no corrections for radiant position made to the counts.
. - = no observations made.
. lots of interference during July 2000.

Mike Boschat

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00

66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi (x form), 4 elements, astronomical azimuth 270 deg
(= E), elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB.
SWR of antenna alone at 66.5 MHz: 1.4/1 (good to very good),
measured with MFJ/259P SWR analyzer (HF-VHF 1.8 MHz to 170 MHz)
on Sep 28, 1998.
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the Ghent University format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

July 2000

Notes:
. ? probably affected by sporadic-E, tropo, direct reception.
. * warning for relative high number of long duration reflections,
an indication for potential stream activity.
. local time = UT + 2 hours

Maurice De Meyere

Location: Astronomical Observatory, Ghent University, Belgium
(ED50 coordinates: 3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation 20 deg
Antenna amplifier: 10 dB gain
narrow band resonance lambda/4 antenna filter
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Will Kelsey

Observer: Werfried Kuneth
Location: Ferndorf, Austria (13 37' E, 46 45' N)
Antenna: 2 element Yagi, direction southeast, no elevation at 1m height.
Receiver: IC-706 at 53.76065 MHz, CW-R mode, 500 Hz CW filter, fast AGC.
Transmitters: 1) 30 kW TV video carrier from Bari, Italy, distance 700 km, direction south and 2) a 30 kW TV video carrier from Sicilia, Italy, distance 900 km, south. The total echo power of both transmitters is processed into same 40 Hz virtual receiver channel.
Observing method: automatic setup using FFTDSP42t software by AF9Y to record the audio signal. 20 channels of 2 Hz width are used for meteor identification, with manual interference rejection.
Sampling interval: one 4096 point FFT every 0.5 seconds.

The monthly results showing the total reflective time are now also available at http://www.qsl.net/oe8fnk this includes now also Es, FAI and radio fireball statistics.

The meteor counts below are corrected for a full hour observing time. If the recording duration is 20-40 minutes, a dot is shown after the value, to show the reduced accuracy. Results for less than 20 min. observing time are excluded.

Counts of reflections longer than 6.5 seconds, assumed to be overdense.

| Jul 2000
```

Notes:
. lots of Sporadic-E propagation, much more than in June and July of
previous years.
. Local time conversion: 2 hours ahead of UT (6h local = 4h UT).
. On July 22 around 18h UT there was an ionospheric experiment going
on - somewhere around Italy? Anybody knows something about it?

Werfried Kuneth

Observer: R.B. Minton
Location: Raton, NM (104 26' W, 36 54' N, 2000 m above sea level)
Frequency: 92.9 MHz
Transmitters: KTZA FM 100 kW, Artesia NM, dist 444 km, geogr azim 178 deg
KSPZ FM 53 kW, Color. Springs, dist 217 km, geogr azim 352 deg

. down for repairs June 1 - 6

R.B. Minton

Observer: Dave Swan
Location: Christchurch UK (50.47 N 1.44 W)
Receiver: Pro 2006 (modified to give a carrier detected
output for Chessell 301 pen recorder).
Sensitivity NFM: 0.5 uV (S+N)/N = 20 dB Dev: 3 kHz
at 1 kHz BW 9 kHz.Calibrated: 1/05/00
Antenna: 4 element Yagi broadband design for 50-70 MHz Gain 9.2 dBi.
Azimuth 95deg elevation 8 deg. Two 3 stage constant K
filters fitted after the antenna, (High and Low pass)
to reduce out of band interference and
intermodulation products causing spurious meteor counts.
Frequency: 66.62 MHz
Transmitter: Budapest 100 kW 24 hrs

Computer: Olivetti 386 Notebook with Meteor v 4.0 software

Note: data are not corrected for Sporadic E.

Pierre Terrier

Observer: Garfield Tsao (BM2EQB)
Location: LonTan Observatory
LonTan, TauYan, Taiwan R.O.C. (121 14'37" E, 24 52'54" N by GPS)
Frequency: 50.0169 MHz USB mode 3 kHz width.
Antenna: Comet made 50 MHz Yagi HB 4 element (gain 10.3 dBi)
astronomical azimuth 225 deg (=NE), elevation 7 deg.
Transmitter: MIYAZAKI University Japan, USB mode, 50 W (24 hours),
distance about 1125 km from Lon Tan.
Receiver: Icon PCR-1000 computer controlled all band receiver
Sensitivity: 0.25 uV for 10 dB S/N for USB mode
Observing method: the beacon 880 Hz voice signal (by FFTDSP) is
received by a low frequency filter (900 Hz)and fed into
the D/A converter and computer in real time.
Data sampling system: using an 8 bits A/D card to PC/AT and Qbasic program
with 1/8 second sampling interval to store the> 1.0 s reflections.

the RMOB results presented graphically. Check it out!

Pierre Terrier

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of

existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

You need to get your antennas above the tree line to minimize the path loss. Yes, the trees will add to your loss.

Jeff

Another cheap alternative is to use only an azimuth rotor & mount the antennas at a 30 degree elevation. I used this for about a year & was able to make short contacts on FO-20 & 29 and a few on AO-10 & 13 as well. Good luck.

The uplink for AO-27 is 145.850

For the most part your Tx freq can stay the same but you DO have to
change RX every few minutes. For instance for AO-27:

Transmit Receive

145.845 436.805 AOS
145.850 436.800
145.850 436.795 MID
145.850 436.790
145.855 436.785 LOS

For UO-14:

Transmit Receive

145.970 435.080 AOS
145.975 435.075
145.975 435.070 MID
145.975 435.065
145.980 435.060 LOS

The French have never officially accepted Greenwich as being the prime
meridian: they have always had Paris as being on the Prime Meridian as the
two were originally in competition for acceptance as the international
standard for defining 0 degrees longitude. I believe that even now, they
define 0 degrees (Greenwich) as being some offset from the Paris meridian.

Au contraire, je crois: they do their mapping with reference to the
Paris meridian, but have redefined Paris by its offset from Greenwich.

AFAIK there's only one country which doesn't use the Greenwich
meridian as the reference for its mapping.

NOAA-L (to be NOAA-16 when launched) will be going up in September at the earliest. It, as well as the next three sats, will support APT. Starting in 2008, new sats will no longer transmit APT.

: Jim (amadeus@DELETE_THIS.netcomuk.co.uk) wrote:

: : Comparing MSF time with the time you get by pressing the 'Time'
: : button on your remote control is also inaccurate. Is that NICAM
: : derived?

: If you discount the propogation delay, MSF time is quite accurate, <1mSec.

: : I understand the pips are locked to the UK Primary Standard at the
: : NPL (in a place called Sussex). The standard is based on the radioactive
: : decay of Caesium.

: (Most of) The National Physical Laboratory is at Teddington, which is quite
: some distance from Sussex. The Caesium standard is based not on the
: radioactive decay but on the transition tine between two hyperfine levels of
: excitation of the Caesium atom.

: The Caesium standard is the Internationally defined standard of frequency
: and time. Individual Caesium standards are "primary" (mine is as good as
: yours) but vary in terms of parts in 10^-14 (errors measured in terms of
: seconds per million years).

Following up my own post:

Following the recent discussions regarding UTC and national time
standards etc., the following is a quote from a recent (4th August 2000)
NPL document :

"The National Physical Laboratory maintains and develops the UK national
time scale, UTC(NPL) which is currently based on five atomic frequency
standards: three Caesium Clocks and two Active Hydrogen Masers. It is
continually compared with others around the world using various time
transfer methods including GPS common-view [1]. The national time scale
provides a reference in the UK for characterising both standard
frequency and time broadcasts, and commercial time and frequency
standards operating at the highest levels of accuracy."

The National Physical Laboratory is located in Teddington, Middlesex -
some distance from the various former sites of the RGO.

My Note [1]

The interpretation of the comparison by "common-view" is that the performance
of the GPS system is not good enough for an absolute time reference, nor
even good enough for a transfer standard (the "Flying Clocks" function). If
anybody is really interested, the frequency & time group of the NPL are

running a tutorial later this year including a section on the uncertainty of
Frequency/time measurement by John Hurll, a friend of mine!

No. They *use* some other meridian for convenience, but ultimately *define* its longitude with respect to the Greenwich meridian.

It looks like NOAA 15 has indeed blown a fuse, and it may very
well be fatal - with a bad scanning mirror, there is little the
satellite can do.

> I read that noaa 16 was to be launched in aug. , will this happen?
> Will 16 transmit VHF APT like the others?

If you had read a little further you would have found that
NOAA-16 is a near-clone of NOAA-15, so, yes, it will transmit
APT. NOAA plan to support APT for some time to come. The new
stuff that's coming up will work better and be easier to use,
so I'm not overly worried.

In the interim I'm putting an HRPT station together. This is
proving very interesting...

The last launch date I had heard for NOAA-L was 29 August, but
that information is a bit stale. Why not check around and
see what you can find out?

Its in Teddington.

>The standard is based on the radioactive decay of Caesium.

Its not. Its atomic resonance.

Its interesting to compare the teletext clocks on terrestial
and satellite channels. The best here are for BBC on Sky digital
although I set my clock to RAI UNO and check it against GPS
and the internet.

The most inaccurate was Spanish canal Sur at -90 seconds.

GBC radio in Gibraltar no longer use the BBC pips and derrive
their time for RDS and the pips from a GPS driven clock.

My system runs the 22.13 kernel (SuSE 6.3) and almost
the same computer. My problem is I can't get the time
correct . Shows -142Jan01 -142:-10:-59 .
Thats my problem Laura

Tosh, decay is the change of the molecules of instable isotopes
into molecules of elements lower down the periodic table. The
rate of decay, described by the time for 50% of the molecules
to decay, is a characteristic of that particular isotope.

Resonance is not associated by decay but by the transition
of sub-atomic particles between different levels of energy.

There may come a time when you see the ISS be disassembled by a bolt or larger object going 8000 miles an hour. Not too long ago a discarded russian booster rocket came within 1 kilometer (.6 mile) of the ISS.

OK, all, some more questions.......

About AO27, UO14, and Sunsat. I've been listening for a week or so, playing with doppler shift, etc etc, just to get an idea of operating procedures and so on.

So I'm ready to make some contacts (if I can) this weekend, and have a couple of questions before I transmit.

I'm using an Alinco DJ-G5 2 meter 440 rig. How do I set it? Do I simply transmit on 2 and listen on 440 for AO27 and U014? Or do I need to crossband somehow?

Also, it won't transmit on the Sunsat frequency stock, so I assume I have to modify it somehow.....does anyone have that mod they could send me?

Thanks for any help, and I apologize for so many questions!

2013. "Insanity" on UO-14

Newsgroup: rec.radio.amateur.space
Date: 2000-08-11 00:00:00 UTC
From: joepwalker1@webtv.net
Message-ID: <1274-39943347-23@storefull-168.iap.bryant.webtv.net>
Source record: 8654

I recently read a posting by someone on this news group expressing concern over the "insanity" in trying to work UO-14. This issue has been on my mind of late and I wanted to post some thoughts regarding the issue.

Like many ham operators, I was pleased when I heard there was another satellite available for the "casual" satellite operator. I have listened to AO-27 over the last couple of years and have been frustrated by many of the operating practices of some of the operators working into it. When you consider the hundreds and even thousands of ham operators who would wait patiently during the week for the AO-27 weekend passes only to hear the same few operators "rag chew" on those precious few passes, it was enough to make you toss that dual band beam you spent hours working on or the Arrow Beam which many people swear by.

It now appears that the same situation is occurring on UO-14. Imagine the frustration of gathering the keps, plotting the passes, going out into the hot sun waiting patiently for the pass only to hear the same folks exchanging pleasantries as the bird is soaring past me.

I'll grant you that many of these operators have spent thousands of dollars on their setup and probably feel a need to work each pass as a "payoff" to their investment. Added to that are the friendships that many of them have made on the satellites similar to the kind that many of us make on two meters or HF. This message is certainly not meant to slam the die hard satellite operators. Rather, I believe that it is through many of their efforts that the satellite portion of our hobby has blossomed. That coupled with the fact that many of them are always willing to share their knowledge with questions that some of us "amateurs" might have.

What does concern me however is I believe that in their quest, sometimes some of the "big gun" satellite operators might forget about those out there who are actually trying what all those QST articles say can be done...working the satellite with an HT and a simple beam. Everyone knows it's possible and there will be many who read this posting who have and maybe often work the satellite using the simplest of setups. However, even those must acknowledge the occasional frustration they must feel in having to listen to endless chatter between a couple of hams who knowingly or unknowingly are wiping out any chance of others working the satellite during those precious few moments of the pass.

Is there a solution? I believe there might be. Perhaps there could be a day each week or a couple of passes each week informally set aside for those who have never worked UO-14 or AO-27 to try to make a contact. For

example, perhaps Wednesday's could be set aside for operators who have never worked the bird. That means, if you've worked it before, don't work the passes on Wednesdays. Once you are lucky on that day to make your first contact, then you also would give the bird a rest on Wednesdays to give the next person a chance.
I don't feel that setting aside a day a week or a couple of passes would offend anyone. I also believe that those elmers out there would welcome an opportunity to bring others into the satellite fold. I think this might also open the door to hams demonstrating the joy of satellites to groups such as school or scout groups.

When I was trying to work MIR on packet, I was "competing" with others each time a pass occurred. Once I made my contact, I moved on and gave others a chance to work MIR. What was frustrating about trying to work MIR was reading about these fellows who proudly talked about how they "worked every pass" to talk to "their friends aboard MIR". What they must have realized was that there rag chewing was making it virtually impossible for others to get that once in a lifetime chance to work the MIR.

I know that I will receive the negative feedback that always comes with posting anything these days on these news groups. Many will say that "competition" to work a station, be it UO-14 or that rare DX station on HF, is all part of ham radio. However, I'm sure that there are still level headed operators out there who must feel as frustrated as I have been over this issue.

Consider another satellite.

While bent-pipe FM repeaters (UO-14, AO-27, etc.) are widely
touted as "easy" satellites, there is nothing easy about them.
They are, in fact, very difficult to use.

I've always felt that any satellite aimed at beginners (which
remains, to a first approximation, all hams) must perform well
enough to show what all the fuss is about. The FM satellites,
IMHO, do not meet this criterion.

If you want easy satellite access, work RS-13 instead.

Source record: 8656

Agreed. Just let others have a chance is all I ask. Give up a high
pass or 2 every week for others to experience the fun. UO-14 is louder
than AO-27 and *should* be easier to work. I gave up on AO-27 because
of the "alligators". I tried 2 UO-14 passes and couldn't get in with a
shoehorn. It's bang,bang,bang...no breaks just nonstop calls.
Imagine what P3-D will be like if it ever gets up. It'll be the same
thing. It took me over 2 years to finally get a voice QSO from Mir.

Is this the same P3D? The P3D I know, from reading technical
articles to seeing bits and pieces in the integration lab in
Orlando has linear transponders with anti-alligator provisions.
These have been tested on the ground, and they perform as
advertised.

My solution to UO-14 et al is brief: don't.

Try ftp.celestrak.com instead, directory /pub/elements instead of
/pub/space.

2022. Re: "Insanity" on UO-14

Newsgroup: rec.radio.amateur.space
Date: 2000-08-11 00:00:00 UTC
From: Ralph Mowery <rmowery@dialpoint.net>
Message-ID: <399475EF.9D9042E8@dialpoint.net>
Source record: 8663

While it may be hard to work UO-14, it is easy to make contacts on the other sats. While it may cost more, get on a sat that is using transponders instead of repeaters. Using ssb gives a small segment of the band and several conversations can be held on the same sat without any problem. When P3-d gets up , it will be easy to make contacts on with the proper equipment. While it may have tken a long time for you to makc contact with MIR, I was able to make contact via one of the RS sats on the second or third pass I tried it on. Probably could have made it on the first one or two if I had not been just playing with my own signal to get the hang of it.

I have an old r7000 and even after the memory battery was changed the freq and channel number goes away if it has been off for a while. The radio seems to function ok otherwise. Reloaded the memory via cat and that also worked fine. I suspect a cap somewhere in the dispay section. Has anyone else fixed this problem, and how did you do it?

Just watched the ISS fly over N.Y. at 9:25 (0125utc) tonight. Man is she BRIGHT! I can only imagine how bright she'll be after the next couple of additions. Always awestruck watching it, Mir or the shuttle fly overhead. If you haven't seen it yet make plans to.
There was another sat heading n.w. just west of the ISS, much dimmer but easily seen. Gotta love it.

I'm just getting into the sats and have only listened so far. I'm really confused about who has the "right of way" on UO-14. It sounds like pure chaos to me. I know the passes are short and everyone wants to get on. It appears whoever has the biggest gun wins. I hear no protocol at all. If I am polite and wait for a proper break I'll never get on. What's the deal?

The capacitors in the DC-DC converter for the display have gone bad.

You are seeing the problems of a new toy in the house, which can only be
utilized by one person, and all the children in the house want to play with
it. Only the strongest get to it.
After a while they get bored, and leave it in the corner. Others get a
chance then.

This also demonstrates why a "single-channel repeater in the sky" isn't
really a good idea. In the case of UO-14 it was done because there are
problems with equipment in the satellite, and this mode that was mainly
intended for testing the receiver and transmitter was now enabled because
that still works.

But on satellites really designed for voice operation, it is normally
preferred to have a wider, linear transponder that can accommodate multiple
QSOs at the same time.
(although there are other difficulties that make managing big guns a
challenge)

Tom,

You couldn't be more wrong about P3D!

First of all, it is NOT a single channel FM repeater. P3D includes
multiple linear transponders. You uplink on a band of frequencies and
the downlink is converted over a similar sized bandpass. So it will
support dozens of simultaneous QSOs.

While UO-14, AO-27, and SO-35 have become the darlings of the handheld
crowd, they can be frustrating because they are indeed just a single
channel FM repeater tha flies overhead for 6-15 minutes at a whack. The
capture effect of an FM receiver means that the strongest signal "wins"
and this perpetuates higher EIRP than is required.

I don't have anything against the FM sats, they have introduced a lot of
new hams to satellite technology. But flying a single channel FM bird in
low earth orbit invites overcrowding and its my own *opinion* that
it has disappointed as many or more than it has brought to this facet of
the hobby.

Thanks for the reply. STS is the program I was looking for. I had used it back in '92 when I first got licensed.

Quick question for you - when you select the "Pass predictions and data output" feature off of the main menu, I can only get it to predict the night time passes for any satellite. I've looked all over, but can't seem to find a setting to show me the daytime passes?! Any ideas?

Thx again

Jeremy, N0USE

The sats can be worked anytime they are passing over. Night or day ,
clear or clouds will have almost no effect on the radio waves.

[cut]

I guess you have "Pass type" set to "Visible". The manual says: "A
visible pass is defined as a pass which occurs with the satellite in
sunlight, the viewing location in drakness, and the satellite elevation
above the true horizon greater than 5 degrees."

Try changing "Pass type" to "All" or "Line-of-Sight". AFAIK, the option
"All" does what it says. The "Line-of-Sight" option, from what I can
find in the manual, ignores passes with a duration less than 10 seconds
or below the specified MinAlt (minimum altidude i degrees above the true
horizon).

Interestingly, celestrak has two objects named ISS: 25544 (ZARYA) and 26400
(ZVEZDA). The latter has not been updated for a while, and they are
drifting more and more apart. Probably it was a temporary situation before
the docking, but the "iss.txt" still has both of them...

Not to mention the much higher orbit, that results in passes several hours
long instead of 15 minutes.

Hi Jeff,
O.K., I stand corrected, forgot about the transponders. You are
right about the FM birds inviting overcrowding. This morning UO-14 was
the usual chaotic mess.

You're doing a great job with the Palm version of you're site by the way!

NO, You use the same polarization, RHCP to receive RHCP and LHCP to
receive LHCP. The only time you get a reversal is when there has been a
specular reflection.

Source record: 8691

Normally you use the same on both ends just as you would with vertical
and horizontal. That is right to right, left to left. There should be
about a 15 to 20 db differance for the opposit polariaty, similar the
the differance of vertical to horizontal.

If the signal is bounced off the moon or other object there is a
reversal of polariaty. Then it is right to left or left to right.

Due to other factors in the air/ionosphere, angle of the sat from where
you are, and such, sometimes the signal is stronger if you use the
opposit polarity. I have seen this hapen many times while receiveing a
sat signal and at the start and end of the passes the signal will be
stronger if I switch the polarity of the beam.

Our club tried AO-27 and UO-14 on Field day and several hogs tied them up each pass. I couldn't believe some guys could be so inconsiderate. We only needed one contact--so did they-- so why didn't they get off after their QSO and let others try????

I have had much better luck lately on RS-13. 2M CW up and 10M down and can make a contact on most decent passes. Much more civilized, fun and considerate operators, as well as room for many qso's at a time.

Steve, K6NT

Joe Walker wrote in message
<1274-39943347-23@storefull-168.iap.bryant.webtv.net>...
I recently read a posting by someone on this news group expressing concern over the "insanity" in trying to work UO-14. This issue has been on my mind of late and I wanted to post some thoughts regarding the issue.

Like many ham operators, I was pleased when I heard there was another satellite available for the "casual" satellite operator. I have listened to AO-27 over the last couple of years and have been frustrated by many of the operating practices of some of the operators working into it. When you consider the hundreds and even thousands of ham operators who would wait patiently during the week for the AO-27 weekend passes only to hear the same few operators "rag chew" on those precious few passes, it was enough to make you toss that dual band beam you spent hours working on or the Arrow Beam which many people swear by.

It now appears that the same situation is occurring on UO-14. Imagine the frustration of gathering the keps, plotting the passes, going out into the hot sun waiting patiently for the pass only to hear the same folks exchanging pleasantries as the bird is soaring past me.

I'll grant you that many of these operators have spent thousands of dollars on their setup and probably feel a need to work each pass as a "payoff" to their investment. Added to that are the friendships that many of them have made on the satellites similar to the kind that many of us make on two meters or HF. This message is certainly not meant to slam the die hard satellite operators. Rather, I believe that it is through many of their efforts that the satellite portion of our hobby has blossomed. That coupled with the fact that many of them are always willing to share their knowledge with questions that some of us "amateurs" might have.

What does concern me however is I believe that in their quest, sometimes some of the "big gun" satellite operators might forget about

those out there who are actually trying what all those QST articles say can be done...working the satellite with an HT and a simple beam. Everyone knows it's possible and there will be many who read this posting who have and maybe often work the satellite using the simplest of setups. However, even those must acknowledge the occasional frustration they must feel in having to listen to endless chatter between a couple of hams who knowingly or unknowingly are wiping out any chance of others working the satellite during those precious few moments of the pass.

Is there a solution? I believe there might be. Perhaps there could be a day each week or a couple of passes each week informally set aside for those who have never worked UO-14 or AO-27 to try to make a contact. For example, perhaps Wednesday's could be set aside for operators who have never worked the bird. That means, if you've worked it before, don't work the passes on Wednesdays. Once you are lucky on that day to make your first contact, then you also would give the bird a rest on Wednesdays to give the next person a chance.
I don't feel that setting aside a day a week or a couple of passes would offend anyone. I also believe that those elmers out there would welcome an opportunity to bring others into the satellite fold. I think this might also open the door to hams demonstrating the joy of satellites to groups such as school or scout groups.

When I was trying to work MIR on packet, I was "competing" with others each time a pass occurred. Once I made my contact, I moved on and gave others a chance to work MIR. What was frustrating about trying to work MIR was reading about these fellows who proudly talked about how they "worked every pass" to talk to "their friends aboard MIR". What they must have realized was that there rag chewing was making it virtually impossible for others to get that once in a lifetime chance to work the MIR.

I know that I will receive the negative feedback that always comes with posting anything these days on these news groups. Many will say that "competition" to work a station, be it UO-14 or that rare DX station on HF, is all part of ham radio. However, I'm sure that there are still level headed operators out there who must feel as frustrated as I have been over this issue.

Yes, zero. The subject of the sentence is "rate of decay",
not half-life.

> OK. So I know what you meant.

I meant what I said ;-)

Thanks to all who responded to my query.

Ralph -- Do you switch both the uplink and downlink polarizations ?
I was hoping to build fixed polarization antennas but maybe that
isn't such a good idea.

The letters I and O are omitted to avoid confusion with the numbers one and zero.

As I recall the letter system starts one time zone West of Greenwich and continues lettering the zones in a westward direction. As a result, Greenwich is the last (Z) time zone.

Hi Jeremy,

I too have started satelite work and have found it much calmer during the
week. But on one pass on Saturday there was only a couple of people on
UO-14. I guess it depends on the pass. You certainly don't need 50 watts.
I use a handheld and an Arrow II.
Seems to work fine. You can certainly tell the operators that are using
high power.

Good luck
Barry D.

The other way, I think: BST is A, CET is B, Singapore/Malaya used to be
GH (I think it's now H), Gan was EF and so on. The double letter indicating
a time zone based on a half-hour.

Agreed, however AFAICR the letters move to the East rather than West.

Source record: 8607

Hi,

I am trying to locate a Science of cambridge (Later to become sinclair) Mk14 computer. The computer was available in a home built kit in the UK and, from what i am led to believe, many were sold to amateur radio enthusiast, as, at this time they were the only people experimenting with electonics in the home build environment. (Hence my reason for posting in this group)

If you have one, or any spares, or indeed any sinclair items ie radios, calculators, watches, etc, working or otherwise, that you would like to sell please email me as i cannot regularly access newsgroups.

I would also possibly be interested in early home computers from the late 1970 to the late 1980s. Preferably boxed but all will be considered.

Thank you in advance.

david.oharrow@btinternet.com

Sometimes I do. I am using the klm 22-c and klm 18-c (think that is the
correct KLM numbers). I don't try to figuer out the what or why but
just know that sometimes the opposit poliarity will be stronger. This
usually hapens as the sat is at one end of the pass. Also just
observing some ground ssb and fm stations (especially the vertical FM
stations) that some will be stronger on rhc and some stronger on lhc.

I believe that antenna sidelobes exhibit opposite sense
in the case of CP. I cannot imagine faraday rotation due
to atmospherics causing a complete change of sense in CP,
but I would not exclude it as theoretically impossible either...

UO-14 passed over me tonight 10:37p.m. cst at 88 degrees ALT in Minneapolis. The best I've seen since I got into this a couple of days ago. Needless to say it was prime for the whole country, because I'm pretty sure every awake ham in the country with 2 meters was trying to work it!!

I agree with Steve - make the one contact and let some other people get a chance, or in my case, their first contact on a bird. I've tried 4 passes with a 50 watt signal and have yet to make a contact because one or two people are either trying to get as many contacts as possible, or their fricking whistling. (what's up with that? Come on...)

Maybe it's just the weekend crowd?? I'm looking forward to trying during the days this next week!!

Isn't it funny that you guys are criticizing other people's bad habits on
satellite, while your are exhibiting bad habits on USENET yourselves?

Please:

- quote only the relevant part of the article you are responding to, not
the entire article. especially when it is long.

- write your response BELOW the part you are quoting, so someone reading
it will see the thread of the discussion (statement, reply, reaction to
reply, etc), not a large inverted blob of text without structure.

Rob

You're Wrong. You made a retards mistake on field-day. You losers showed up at field day planning to make only one or two satellite contacts which is totally contrary to field-days purpose. The HF side of your group didn't show up at field day only able to work one band, why did you show up at field day only able to work one type transponder? It's because you're a Loser and someone needs to take a black felt marker and write the word "RETARD" on your forehead. My advice: When you go to field-day next year, you need to set up an oscar station and plan to work as many stations on as many different satellites as possible. That's the whole point of field-day.

You don't have to take my advice, you can remain a loser if you wish. Just stop your cry-baby whining!

According to http://www.timeanddate.com/time/abbreviations.html
you're both right. Except that the omitted letter is J and the
zone containing the International Date Line has two letters, M and Y.

When the signal is reflected, the circular polarisation sense changes.
At low elevation, you get a reflected signal against the ground, and
possibly against surfaces like large buildings, mountains etc.

This reflected signal, when it cannot be discerned from the direct signal
(i.e. when linear polarisation is used) will cause cancellations and is
responsible for nulls and peaks in the signal when the satellite nears
the horizon. (similar to aircraft flutter)

When circular polarisation is in use, the reflections will not cause nulls,
but it may be that at certain points the reflected signal (which has
opposite polarisation) is better than the direct signal.

Finally, some satellites do not really use circular polarisation
themselves, but the use of circular polarized antennas is recommended
because the satellite spins. On those satellites, switching polarisation
between circular and linear (in various planes) may of course have a
marked effect, especially when the plane of polarisation is reasonably
constant as seen by the receiving station. This usually happens at
certain points in the pass, e.g. at AOS or LOS.

You may, in these cases, also see a difference between LHC and RHC just
because your antenna pattern isn't perfectly circular, but is elliptical
and the orientation of the ellipse changes when switching from LHC to
RHC. This is nearly always the case when crossed yagis are used and the
mounting and wiring is not perfect.

The question always remains if the extra complexity and losses of a
switchable system outweigh the benefits. I have had a fixed-RHC system
for a while, and sometimes the signal was not very good. RHC/LHC switching
can be done fairly easily (like in the MASPROs), and is probably worthwile.
Switching through all possible polarisations is much more complex...

Proposed new question for the extra class exam pool:

What is the correct center frequency for the oscar 27 downlink?
a. 436.792
b. 436.795
c. 436.797
d. 436.800

Seriously, I just want to know. All 4 are listed on the web at various places for the correct freq. I'm not talking about doppler adjustment. What freq is the bird actually transmitting on?

Message-ID: <3999721B.A1D4694F@rac.ca>
Source record: 8617

Hi

I always use 436.795 as my handheld will only allow 5 khz steps.
Until I read your posting I had never noticed the conflicting info.
I have 2 issues of Amsat News one says .795 the other says .792
The AMSAT AO27 FAQ says .795
I don't suppose it matters that much as we all adjust for the best
signal anyway. I think the Yaesu 847 users have 1 khz steps, and may
have a better answer.

From http://mocc.vafb.af.mil/launchsched.asp, the current
launch window for NOAA-L is 1022Z to 1032Z on 14 September.

Southern California insomniacs should get a great show.

2089. 1.6 GHZ Antenna and WX Sats

Newsgroup: rec.radio.amateur.space
Date: 2000-08-16 00:00:00 UTC
From: John Reed <jreed@NOSPAM.thor.atl.ga.us>
Message-ID: <spm6e7jbr5j123@corp.supernews.com>
Source record: 8624

The house I recently purchased was formerly owned by a ham. In addition to the 144Mhz and 432Mhz yagis on the satellite array, there's a 1.6 Ghz loop yagi with a preamp on it, too.

After doing a bit of digging, the 1.6 Ghz is used to listen to GOES.

The question at hand is this:

What is the easiest (read CHEAPEST) way I can actually utilize this antenna to get weather sat pictures? What software is needed and what hardware (receiver or downconverter?) is needed to get the pics. I have a Yeasu 736 radio that I use on the ham birds - although it doesn't drop low enough for the 136mhz or whatever freq the GOES birds also use.

Thanks in advance.

Please reply to my email address (remove the NOSPAM) - as I don't check this newsgroup often.

Thanks!

John, N4TII

Do you want easy or do you want cheap? They're different.

Easy: buy a commercial system.

Intermediate: buy or build an LNA and downconverter. Buy
or build a suitable IF receiver. Check Downeast Microwave,
Hamtronics, etc.

Cheap: Modify a satellite TV tuner. The modern ones tune
950-2150 MHz. Tap in to the 400-odd MHz IF with a scanner.

Software: same as for low-orbit APT satellites. There's
been lots of discussion in this newsgroup.

When it went up it was 795 as the crystals has aged the frequency has
trickled down. 791 0r 792 is more likely correct now based on
observations made with my FT-736.

As a practical matter start looking for it at 805 as it comes over the

horizon and step down 5KHz as needed for Doppler correction. I can do
finer that that but find I don't need to.

I could never understand why we don't all use the same time zone, everywhere on the world and above it ie.
"Earth time".

As I write this it is (approximately) 14.00h GMT (or UTC or whatever they call it now!), it is 10.30h local
time, and 09.00h in the two major cities of the country I am in!

I'd be quite happy if the alarm clock went off in the morning at 03.30h (7.00 am now) and I'm out the door
to arrive at work at 05.00h (8.30 am now). Soon get used to it! Save a lot of confusion.

Imagine an intelligient being, zooming towards earth; "Hullo earthling, what time is it there on earth?".

Imagine the reply, probably from some radio ham who has stayed up all night, "Uh, well, hmm: Well you see
this planet is turning around, approximately once every 24 hours so the time where I am is, just a minute
let's see; 53.2 degrees west of Greenwhich ....that's, what is it per degreeg? Oh. Heck. I'll call
you back."

Intelligient being; "Roger on that. BTW what is an 'HOUR'?; and what is Greenwhich?".

2094. WX Sat receivers -- which one?

Newsgroup: rec.radio.amateur.space
Date: 2000-08-17 00:00:00 UTC
From: tegwilym@my-deja.com
Message-ID: <8nhfao$jo9$1@nnrp1.deja.com>
Source record: 8631

I am interested in getting into the WX satellite receiving hobby and I think I have narrowed the choices of receivers down to the following:
- Ramsey receiver (kit or built)
- Hamtronics receiver (kit or built)

It seems that the Ramsey kit comes with an antenna pre-amp and is less expensive for the completed kit. The Hamtronics is a little more expensive and seems to have the pre-amp as a separate thing.

I am debating whether to get the kit or the completed radio. The main concern is test equipment that may be needed, mainly the signal generator. I contacted both of them by email and Ramsey said that theirs could be built without using a generator, but Hamtronics said that they would recommend using a good generator.

So, for $200 I could get the Ramsey completed radio or for $239 I could get the Hamtronics. (or the kit?)

I am planning on using a computer sound card to capture and create the images on both of them.

As for an antenna, I will build that myself. I will probably start with a crossed dipole and then maybe later try to build a fancier QFH type of thing.

I'm living in a condo now so I have to deal with all the antenna restrictions. I'm looking for another way to get back into the radio hobby since HF may be a challenge now (unless I try some kind of loop!)..but that is a whole different topic!

Anyone have any advice, tips, hints or ideas for me?

Thanks!

You may also look at finding a scanner for under $ 50 at a fleamarket
and just replacing the IF filter with a .01 uf capacitor. This will
give the bandwidth you need and you would have money left over for a
preamp if needed.

Any idea if an old Radio Shack Pro-28 handheld scanner would work with
this? I have one of those, but I'm not sure if I have the schematic
for it around anywhere to track down the capacitor.

Will it tune to 137 MHz?

You don't need a schematic to identify the IF filter and replace
it with a capacitor. You also don't need to worry about this
right away. With the stock IF bandwidth you will hear the
satellites (Have you tried? Why not?), and you will get
pictures. Not necessarily very good ones, but enough to opti-
mize your antenna, preamp, software, etc.

I did try to receive a satellite, with it, but I was just using a whip antenna indoors. I guess this should be enough to at least hear if there is one passing over. I may have done it at the wrong time also. I did use the J-Track satellite tracking web page to track one of them, but I think I was off on my timing. Or of course it could have been one of the satellites that wasn't transmitting at the time?

The scanner will cover the needed frequencies, but I'll just have to make the capacitor change to it and see what happens.

I'll try to track them again and figure out when one of them will pass over and see what I can hear. At least that will give me an idea of how they sound and how much improvment I would need to do. I have received satellite pictures from HF in the past using a PK-232 TNC and a dot matrix printer. I tried to do that with the computer sound card using the TNC indicator to tune in the satellite. I wasn't successful, I just got a bunch of unsyncronised stripes on the screen. Oh well, I'll keep working on it!

2100. Basic EME Qustion

Newsgroup: rec.radio.amateur.space
Date: 2000-08-17 01:43:46 UTC

Hi. I've been interested in EME for a while, and have been fortunate to have heard a few CQ QSOs via this mode. I have yet to have a QSO mainly since I have only 150w available on 432 and only a single 12el yagi. Man-made satellites?..Yes. Our planets natural satellite?..Not yet.

Assuming one knows when, where, and how to aim an array (computer-aided antenna orientation) without the need to see the moon, does cloud cover effect EME communications?

Just curious because someday I'll get to it...if two kids in diapers don't spend all my money for me. :)

Thanks,
Tom KB2FIK

Hi David

I have what could be F9TIL (I wrote F9TL) marked down on the UO14 pass
for 13:49 UTC on August 11 it was an 11 deg. pass for me.
I did not make contact as the stronger eastern US stations came on the
bird and wiped him out.
I have however made contacts with G7NFO, G0AUK(W2RS) G1OCN & CU2AHD
on UO14 when the angle here (Ontario) is between 15 - 10 deg.
They are the first pass in the morning about 13:00 - 14:00 UTC
I see from QRZ you are in Brooklyn so you should be able to work about
the same passes I do.

This is now my favorite part of the hobby waiting for the southbound low
angle passes.
I use and ADI handheld at 5w and an Arrow antenna.

Does anyone know If one has to submit qsl cards to arrl for having made
succesful contacts for awards, say having made first 20 or 100 contacts
via satellite or will a list with time and date and gridsquare suffice?
And do people usually qsl for fm contacts?
Thanks for any information in advance.

I have some sample sounds (NOAA-14 and RESURS O1-N4) on my web
page at:

http://www.qsl.net/ve7ldh/wxsat.html

Both wav and mp3 format, no less. :-)

> I have received satellite pictures from HF in the past using

If you're receiving HF signals you are not receiving satellites.
These signals (interesting and worthwhile in their own right)
are transmitted by terrestrial stations. There is no mystery
to the tuning: any softwre worth using provides a tuning
indicator.

I'm intrigued by the charts sent from the Canadian Forces station
in Halifax. They are marked up by hand, and the same person does
it all the time. I wonder whose handwriting I'm seeing...

2108. Yaesu 8500 Memory Problems?

Newsgroup: rec.radio.amateur.space
Date: 2000-08-18 00:00:00 UTC
From: Darren Williams <dlwjmw@eagnet.com>
Message-ID: <399D8F06.3E0E45C@eagnet.com>
Source record: 8645

I have a problem with my Yaseu 8500. When power is removed from the

power cable for more than 30 minutes then turned back on the radio goes into VFO mode and the squelch opens for both VHF and UHF. It will not do it if you remove power for about 5 to 10 minutes then turn it back on. It doesn't totally wipe out the memories though because it still has all the programed repeaters that I have programed in memory. Currently the radio gets power when my car's ignition is turned on (it is not connected straight to the battery). Is this a sign that the internal battery is going out or does this radio even have an internal battery? Has anyone had any similar problems? Any suggestions would be

appreciated.

Yes, I do realize that, those are just images that are re-transmitted on the shortwave bands. Not as exciting as getting the real thing directly.

I was playing with the WXSAT software on my computer and HF rig just to see if I could copy some of the images. I wasn't sure about the tuning so I was using the TNC along with the software to see what it would look like. I am putting the signal into a Soundblaster 16 bit card on the computer. I read somewhere on another site that you should separate the L and R stereo channels on the input and just go in on the left channel only. Do you know anything about that?

The NOAA satellites transmit all the time. The Russian ones
generally only transmit when they're in the sun.

These satellites are loud. I heard my first one by accident,
and I got my first (really bad :-) pictures from NOAA-12 with
an unmodified Pro-43 and a rubber duck antenna.

If you can't hear the satellite it won't make any change at all.
At least figure out your tracking before you proceed.

Be prepared to find that many stations don't send QSL for contacts via a
repeater. YMMV.

To find out what you can work, use a decent tracking program. Most can
draw a map indicating coverage circles etc.

Thats true, left channel only is what I've been using...
I might also strongly recommend a program called SatSignal which converts wave files to color images and has alot of features.
http://www.davidtaylor.freeserve.co.uk/software/satsignal.htm
The color images on my page (http://www.gravitywell.org/wefax.htm) is done
with satsignal (such as http://www.gravitywell.org/wefax/08101606-c.jpg), dont leave home without it :)

Is oscar 27 working as normal lately? I heard it at NIGHT, quite clearly at about 21:47 edt over maryland and it was some kind of digital mode. I thought it was analog, and only on for the morning and mid-day passes. I don't do digital and dont know if it was packet or what. I also heard it this morning making modem-like noises, no voice. I'm new to satellites and could use some help, obviously. I've been trying to hear this bird for a week or so and all the while thought I did not have enough antenna.

2121. Re: AO-27 in digital?

Newsgroup: rec.radio.amateur.space
Date: 2000-08-20 00:00:00 UTC
From: Peter Hodgson <va3pkh@rac.ca>
Message-ID: <399FE9E4.6FC4EFBC@rac.ca>
Source record: 8555

AO27 has not ben available for amateur use for quite a while (2-3
weeks).
The controllers asked that Amateurs not use the sat while they are
working on the problem.
What you are hearing is probably the control station trying to upload /
download commands. They have been keeping us posted, on the progress and
will let the newsgroup know when it is useable again.

Hope it's soon

Eucalypt Software - Makers of Autopost & Rocketfuel --- Ripped Me Off!!!
-
All potential buyers should be warned to steer clear of this company. They have a repeated pattern
of ripping people off and ignoring requests for support.
-
I know someone who sent in the $10 registration fee for Autopost TWICE (thinking the first one may
have gotten lost) and in both instances, never got a registered version of the program and all of his
emails were completely ignored.
-
I myself purchased Rocketfuel on-line and had to pull teeth to get an unlock code. The web site was very
quick to take my money, but no registration/unlock code came for days and days. I repeatedly emailed them,
only to receive nothing but autoresponses. After 5 days I sent them a message stating that if I did not have
a working version of the program by the close of business that day, that I would challenge the credit card
charge. Magically, the code arrived several hours later.
-
What kind of way to do business is that?
-
In any case, its academic... there are other products available for free that do virtually the same thing
and I only wish that I had known about them before I wasted my time with Eucalypt Software.
-
If your in need of automatic news posting software, there is nothing better than "NNTP Power Post 2000".
It's graciously been made available free from the following web site:
-
http://net-toys.8k.com/
-
Save your money... your time... and the aggravation!
-
Peace,
-
PPN
-
-
PS: I have no affiliation with the makers of PowerPost 2000.
-

Message-ID: <sq0nsqt887v33@corp.supernews.com>
Source record: 8558

I was using a scanner that didn't have a real fine step size, so I don't think I was really able to compensate for doppler enough to pick it up. I tried it with my HT and set the step size to 5 kHz and was able to hear it OK with a 2m/440 whip. Maybe sensitivity was better on the HT too...I dunno.

Thanks for the input,

Rodney

2125. feeding arrow antenna

Newsgroup: rec.radio.amateur.space
Date: 2000-08-20 00:00:00 UTC
From: glathrem <glathrem@hotmail.com>
Message-ID: <8nq4gj$334$1@slb6.atl.mindspring.net>
Source record: 8559

I want to home brew something like the arrow handheld satellite antenna. Since I'll be using a HT with one antenna input and not full duplex, how would I connect it? In my research I downloaded the instruction manuals for all the cushcraft "dualband" uhf/vhf yagis. It seems that like the arrow they are not really dual band at all but rather, two antennas on a single mast. They connect the two driven elements coaxes together with a simple tee connector and then feed a single coax to the rig. I just need to know that that tee is not really a duplexer,diplexer,splitter or whatever. Can anyone with a CC dualbander comment on that "tee"? I'm also curious how CC gets away with mounting both sets of elements in the same plane unlike the arrow which at least has the elements for the different bands mounted 90 degrees to each other. Does that not cause any problems? If I went out and bought the arrow without the duplexer, and just connected the two driven elements in paralell with a tee connector will I get good results?

When it switches quickly and the satellite is reasonably far away, you
could maybe hear your own signal when you whistle and unkey...?
But in general, a half-duplex transceiver is quite unsuitable for working
satellites.

Source record: 8562

Remember that with FM satellite work you want to operate duplex. (It isn't fully necessary, but is desirable.) So you want maximum isolation between the two antennas. 90 degree rotation helps a lot. However, you probably don't want the uplink power applied to the downlink receiver using a simple T connection. :) If you have a rig with separate UHF and VHF antenna connections, you can skip the diplexer.

I will be doing this with a single HT which is not full duplex. The Ht will hook to one coax. That coax will go to a tee connector and connect to two coaxes which will go to the two driven elements. It appears from the instruction and assembly manuals that I downloaded from the Cushcraft site, that is how all their dual band vhf/uhf yagis are fed. (all of them, not just the ones they call satellite antennas) I'm not 100% sure but I think the receiver is isolated from the antenna during transmit.
I realize a seperate tramsmit/reciever or full duplex rig would be better but I'm working with what I have. The arrow sells with an optional duplexer. I don't see why I would need it with one half duplex radio. The cushcraft manuals for their satellite specific antennas make no mention of a duplexer. I do not think that "tee" could be anything but a simple connector as the CC antennas sell for about the price of a duplexer alone. Do you understand my original question?

Don't be surprized I have a friend who has tried numerous times to get
on uo -14 with an ht out of 10 trys when directly over head he got in
once, what really makes it even harder is the pile ups here in the east
coast, the latter 2 passes towards the west I notice are best which
have a much more casual tone without the quickness of quickdraw magraw.
PS get some sort of directional antenna circular or beam, I use a
cushcraft 13b2 and can definetly pullout 3 1/2 passes.
73 and good luck.

As long as you uplink on 2m and downlink on 70 cm, the only thing that will
be degraded by this setup is the 70 cm pattern and gain of the antenna. Since
the sats are pretty strong, this probably won't kill you, though you'll lose most
of the reception advantages of the beam.

But if you try it the other way, then the 2m driven element looks like 3 1/2-waves
fed in the middle on 70 cm, and that has the same impedance as the single 1/2-wave
fed in the middle driven element which is in parallel with it on the 70 cm side. That'll
affect uplink pattern and gain as well as VSWR. With a HT as the transmitter, that'll
probably be enough degradation to keep it from working.

So using a Tee instead of a duplexer may work for mode J, but it won't cut it for
mode B.

...and?

You seem to have all the bases covered. Until the satellite is
launched, what more can you (or anybody else) do?

What are your plans for the 1270 MHz uplink? 5660 MHz?

Just how much are you prepared to spend? Sufficient uplink power
is available for all of P3D's uplinks, albeit for a price. The
most expensive uplink at the moment is probably 2.4 GHz - you
can buy bricks for 1270 MHz, and there are surplus amplifiers
(TWT and GaAsFET) for 5670 MHz.

How would you solve this problem? It's one thing to say
"somebody else should do it". It's quite another to say
"here's what I'm going to do".

Me? I have a trip to Silicon Valley planned in the fall, and
my employers are threatening to send me on a business trip
to Dallas. Both areas are well endowed with electronics surplus
places. I will be there, credit cards at the ready...

Well, back to my original question! Any recommendations on the
Hamtronics vs. the Ramsey receiver (or kits?).

I have learned a lot of good information from all of you about this
part of the hobby. Thanks!

Tom

I am moving house next week and will be able to erect a decent antenna system for weather & Ham Sats.

My current tracking software is:-

STS Plus 9848

Tracksat Version 4.00

Predict

Are any of these programmes likely to give me correct passes as I haven't used them since last Year.
If I update the TLE will I get the correct results, as I have heard that a lot of software is giving incorrect results

August 21, 2000 -- For most amateur radio operators, it is the thrill of a lifetime to receive a "CQ", or general call, from an astronaut in space. But for some, like former astronaut Dr. Owen K. Garriott, call sign W5LFL, the thrill comes from receiving a response from "hams" down on Earth.

The rest of the article is at

Has anyone modified a Bearcat 21 scanner? I saw some mods on one of the websites (some link from www.hffax.com someplace) that had some modification for that scanner. I have seen that same scanner on Ebay for pretty cheap, usually several for sale.

I guess I should start with an antenna (cheapest part) that I can build and go from there.

One possible mod usually is to remove the 2nd IF filter (usually a small
black plastic almost-cube) and replace it by a wire or a small ceramic
capacitor from input to output (the two pins on the filter that are not
connected to the ground surface). You could also replace it by a wider
type (same prefix but with last letter A instead of the type D or E usually
used), but that could be hard to find and may not be worth the trouble.

>I guess I should start with an antenna (cheapest part) that I can build and

Good results are often reported with the "quadrifilar helix".
Designs can be found on the WWW.

Newington, CT August 24, 2000
To all radio amateurs

SB SPACE ARL ARLS007
ARLS007 AO-27 FM repeater off the air

Amateurs are being asked to stay off the AO-27 satellite uplink as ground controllers try to restart the satellite following a July 31 software crash. The request from ground controller Michael Wyrick, N4USI, comes as ground controllers are attempting to reload the satellite's software.

''The analog repeater is turned off, so you will not be heard, and you will interfere with the software upload process,'' Wyrick said in asking for the cooperation of the amateur community. He says ground controllers are working as fast as they can to get AO-27 back in operation.

AO-27 contains an FM voice repeater that uplinks on 2 meters and downlinks on 70 cm. A project of AMRAD, it was launched in September 1993.

The satellite's CPU rebooted again after controllers tried to run uploaded high-level code. Ground controllers still are at a loss to explain the second reboot, but Wyrick says they are looking into several leads.

Wyrick says the AO-27 exciter on 435.797 is turned on full-time and operates at low power during uploads.

Wyrick also requested that hams not flood controllers with e-mail asking when AO-27 is going to be back on-line.

What about a crossed dipole antenna? I have been looking at plans for those and they seem to be a lot easier to buid (or at least find parts to build it out of). I did see some plans that were included in the Ramsey WX receiver kit instructions that I downloaded for building the dipole type. The only thing that seemed like it would be hard to find was the 90 Ohm RG-62 coax. I guess that could be found on the internet after searching around a bit.

RG-62 coax is readily available. The last time I bought some (at
a surplus store) I asked what it was used for, and they told me
it was used for car radios.

Why not actually *try* some of this stuff? You can ask the net all
you like, but answers - real answers, answers that you can use -
will only come from trying it and seeing for yourself. Nothing
personal, but it sometimes seems like people hesitate to take a
dump without checking with the net first...

Yeah you are right! I have been asking to many questions without doing anything about it. I just put in a bid on Ebay for a Bearcat 210 scanner and I found a web page that has a modification that can be done to it www.uvm.edu/~swarley/bc210.htm so it will work on the needed frequency and bandwidth. If I blow up the radio no big deal it's a cheap one anyway!

Ok, no more silly questions until I actually hook up my old Pro-38 scanner and actually try to hear a satellite pass. Yeah, I won't get a good picture, but at least it is a start.

It is just so easy to get answers on the internet now that it is just so tempting to keep asking questions! :-)

I'll start by buying a cable so I can input a left channel into my sound card and go from there.

As you only need a couple of feet or less of the 90 ohm coax, you might want to look at making some. As the 9913 type is good to use from the ant to the receiver and you will probably be suing some of it, you can cut off a foot or whatever and pull out the cinter wire and replace it with something smaller. I haven't done the calculations for the size but it will probably be around # 20 or so. The size will be important for the matching, but not for the power handling or loss as it will only be a short piece.

> Good results are often reported with the "quadrifilar helix".
> Designs can be found on the WWW.

I built one, and have been *amazed* with the results. Before, with either my ground plane or discone, I could only hear the satellites when they were at least 15 degrees above the horizon and would get many fades, I get great reception with the QFH, often starting at 2 or so degrees. I really couldn't believe it at first.

I'm presently using an Icom R-7000, but have ordered one of the RX2 kits from the RIG, as the R-7000 doesn't have suitable bandwidth filters. I've found that using the FM wide filter results in very low signal strengths, so I've been skeptical of the claims of taking a standard scanner and replacing the IF filter with a cap, I would expect similar results.

The difference in price is minimal, so which is important to
you: the scanning capability of the Ramsey radio, or the
idiot-proof crystal control of the Hamtronics radio?

I'd still recommend playing with a cheap used scanner
before investing in a dedicated radio. Any antenna work
you do will pay off, as well as experience in tracking
satellites and decoding images.

Since no one seems to have answered this basic question, I will.
Ramsey kits suck. Even if you follow instructions carefully, they
won't work right. You will have to modify them to get them to work
right. Hamtronics kits aren't Heathkits by any stretch, but if you
build them carefully, they do work right as designed.

See? This is why certain of us curudgeonly types have been leaning
on you to try it and see. By actually trying it you can see how
strong the signals are, so you don't need to stress over preamps
at first. You can figure out how to get signals into your
computer and get pictures - using your software with real data.

There are lots of pieces that need to fall in to place, and
only by doing it can you figure them out. Good luck.

One suggestion: try just recording the signal during the pass,
and processing it offline later. And don't go overboard on the
"left channel" stuff - if you can get a decent recording, any
software will do nice things with it.

If you don't know what a plastic IF filter looks like, find
somebody who knows what they're doing to do it for you. But,
as you have just found, there are lots of other prerequisites
you need to have in place before this becomes an issue.

But if he actually does need more gain, the best circuit I've seen uses
a MMIC as the second stage. Besides gain, this also has the advantage
of isolating the low noise preamp from any impedance mismatches and
reflections on the downlead coax. That can sometimes cause instability
in transistor preamps, and/or degrade the noise figure.

I think this was in one of the Central States VHF Conference Proceedings,
available from the ARRL.

Thanks for the answer! I have built some Ramsey kits in the past (20m rx, 20m transmitter, and aicraft reciever) and I don't think I ever got them working right. Of course I blamed myself for screwing it up, but maybe there was a different reason!

I just won an auction on Ebay last night for a Bearcat 210 Scanner. I found a web site that shows how to modify it for APT, so I'll give that a try. If it doesn't work, I only lost $20.

I found some plans for a cross diplole in the ARRL Weather Satellite handbook that I got from the library. It doesn't seem to need any fancy, hard to find, 90 ohm coax. Just some PVC pipe, 50 ohm coax and some twin lead tv cable for the elements. This one has the driven elements and the reflectors below them. I have seen plans for antennas that don't have a reflector but rather just a crossed dipole and nothing else(Ramsey kit instructions) but this has the 90 ohm stuff. I would like to build something that isn't too huge that I could put out on my back patio (or possibly in the attic) that wouldn't attract too much attention from the Condo management or neighbors.

I already got a complaint from one of the neighbors that my curtains didn't meet the proper color standards in the condo regulation book. Hey, I got them for free, what do they expect? :-)
So I know if I have some kind of strange antenna farm growing above my patio fence I'm worried I'll get caught.

I still have lots of radio plans though, just with stealthy antennas!

Actually, how about http://www.qsl.net/ve7ldh/wxsat.html

Nice pictures, BTW.

Anyway, any speculation why reception is so poor on the R-7000? Could it be
that the IF circuitry in a typical scanner limits the bandwidth to
something close to the 30 or 40 kHz that is ideal for APT reception?

BTW, keep us informed on your HRPT progress.

>

Ok, I just tried out my old Radio Shack Pro-38 scanner and was able to hear 3 different satellite passes tonight. I was just using a 5/8 wave 2 meter whip antenna on the scanner in the house just to see if I could hear something. I was surprised how strong the signal was even when it has just come up over the horizon! I did attempt to hook it to the computer (on the left channel of the sound input) but wasn't successfull at even getting anything ajusted right to get any image. I wasn't expecting that to work anyway, but just checking that I could pick up a signal with basic stuff. It was interesting how the change of the tone was very noticeable from the doppler shift, I can see now why a wide bandwidth radio is important.

I just won an auction on Ebay for a Bearcat 210 scanner, I'll try to modify it from the info I found on the www.uvm.edu/~swarley/bc210.htm web site. If I blow it up, no big deal, it only costs me $17 plus shipping!
I found the manual for my Pro-38, but there was no schematic in it. Any ideas on where I would stick in the .01uF cap in that radio to widen the bandwidth?

I might scrounge up some parts this weekend and try to build one of the many antennas from plans I find on the internet.

You most likely do not want more gain. What you need is a low noise level,
and at 137 MHz with an antenna that is not very directional, it will
probably be low enough when using a Mosfet. If not, try a GaAs fet instead
of your Mosfet.

Lowering the noise level even more will not help, because the thermal noise
from the earth and the cosmic noise from space will not decrease.

Increasing the gain will just serve to overload your receiver, unless you
use a long length of bad coax inbetween.

Put the amplifier near the antenna when you have not yet done so. That
will do more than trying to squeeze out the last dB.

I'd like to build a good, new preamplifier for the 137 MHz band.

Currently I do use a single Mosfet preamplifier but I need more gain withouth the problem of self-oscillation when trying to squeeze last dB out of such a preamplifier.

Now I am looking for a something like a two stage, proven, reliable preamplifier SCHEMATIC, I don't want to buy a commercial one any way !

Thanks in advance and best 73s,

Giovanni IT9XXS

I presume you are talking about a Dual-Gate Mosfet (4 connections).
I have built a couple of these for 2M and 70cm, and in my experience they
don't oscillate too easily. Of course, I don't know what your "quite good
layout" is. Maybe you are trying to use a bare unscreened PCB?

I used Mosfets like the BF900, BF905 and BF981 and later some 3SK97 GaAs
fets (dual-gate as well), and I have good results using a small box of tin
plate or pcb material, with a screen across the centre. In the center of
the screen, there is a 5mm hole where the Mosfet is mounted, G1 and G2 to
one side and S and D to the other. The source and G2 are soldered to a
leadless capacitor to the screen (ceramic plate or SMD type), that serve as
mechanical supports at the same time. The G1 and D are wired to the
respective resonant circuits.
Because of the high impedance transformation ratio, the input circuit
is crucial. The capacitor should be of good quality, e.g. a glass or
air trimmer. It should be straightforward to get a 1dB noise figure
at 137/144 MHz using a 3sk97, and maybe 1.2 with a Mosfet. That is good
enough for this frequency.

G2 voltage can be made adjustable, which provides a crude gain control.
The gain could be up to 20dB. That is why you need the shield between
input and output circuits.

I had better results with these preamps than with a commercial box from
SSB electronic. It had too little preselection and suffered from intermod
with paging service transmitters, and also mobile telephony base stations
when these were still on VHF.

I always mounted them directly under the rooftop (a few metres of coax to
the antenna and a longer run to the shack) because occasionally one
transmits into them (as a radio amateur)... I have replaced the 3SK97s
several times...
(I used a coaxial relay under the rooftop, amp directly plugged to it,
two cables down to the shack, final amplifier in the direct cable, and then
another coaxial relay towards the (commercial) transceiver. When the
relay doesn't switch over for some reason, the preamp is usually gone)

Source record: 8460

>Iam new to the sat's ! Do you change the uplink freq if you
>change the downlink freq do to the doppler shift? What is the
>uplink to AO-27? Thanks, Sam alphacentauri@i-plus.net

The uplink for AO-27 is 145.850

For the most part your Tx freq can stay the same but you DO have to
change RX every few minutes. For instance for AO-27:

Transmit Receive

145.845 436.805 AOS
145.850 436.800
145.850 436.795 MID
...

AO-27 has a wide-band receiver and you do NOT need to compensate for doppler
on the uplink.

http://www.amsat.org/amsat/sats/n7hpr/ao27schd.html

Indeed, it is requested that you do not do this if possible. FM occupies
alot more of the satellite sub-band than SSB. If you also add in doppler,
averaged over the time period of a pass, your terrestrial signal will occupy
twice as much space in the 2m satellite sub-band. If a linear transponder
is overhead at the same time (AO-10, FO-20, FO-29, RS-13, or soon, P3D),
then this can be a potential problem.

Compensating for doppler in mode J-FM is not only not worth the trouble, but
it's unhelpful as well. I believe the same applies for UO-14 and SUNSAT
when it's in J-FM mode.

-- KD6PAG (Networking Old-Timer, satellite QRPer)

P.S. It doesn't take much power either, i usually run 1W and often 140mW
on non-transcontinental passes into an antenna similar to an Arrow (which
is strongly recommended for J-FM work).

2176. Re: 137 MHz WX Good Preamplifier Schematic Needed

From: Hercules <hercules@coolmail.net>
Message-ID: <8o74moetu1@nslave2.tin.it>
Source record: 8458

Thanks Rob for your reply, I was just using the Mosfet preamplifier ahead of the antenna and the coax is not much long, but quite often it start to self-oscillate (I don't want to go up and down from the roof any more trying to solve the problem). Layout is quite good and the components are good quality too, in my opinion the gain is just too much. The radio is not much sensitive, but this is not an issue, so I'd like some more gain near the antenna. That's why I'm looking for a reliable preamplifier that won't oscillate too easily, and I think that a low-noise two stage preamp is much more stable. I use a Lindenblad-type antenna and it performs very well, rejecting much of the local man-made noise too. One could even retune a 144 MHz band preamp suitably...
Any help will be appreciated.

2180. Decoding WxSat .wav files into image - question!

Newsgroup: rec.radio.amateur.space
Date: 2000-08-27 00:00:00 UTC
From: "Tom G." <tegwilym@wolfenet.com>
Message-ID: <SUnq5.1256$yF4.219979@den-news1.rmi.net>
Source record: 8465

I just got a basic APT station up and running. I am using a turnstile dipole, no pre-amp, WxSat Software and a Radio Shack Pro-38 scanner. I know the bandwidth isn't very good on the scanner, but I'll work more on that later.
I just go the antenna built and was able to download an image and saved it as a .wave file. I can see there is some kind of image in it when I process it, but it is all skewed to the side. It appears that I just need to set up the horizontal sync somehow to set up where the picture should start and end on each line. Right now I just have a bunch of angled lines across the screen at about a 20 degree angle. I can see there is a picture in there, but just can't figure out how to straighten it out.
The satellite is the Meteor 3-5 that I received the picture from this morning on a nice pass where it was about 60 degrees above the horizon. Sounded really strong as it passed over!

Help!

Tom KA7VIK -- Satellite newbie!

Ok, here is the latest update on my current experiments.

I just built a "Zapper II" type of turnstile antenna, the one with the crossed dipoles and crossed reflectors at the bottom.

http://psbsgi1.nesdis.noaa.gov/EBB/pubs/sympos/symp33.html

I have it attached to a wooden pole and it is about 4 feet off the ground and leaning against my wooden fence. It is just below the top of the fence so hopefully the neighbors won't see it as they walk by. I hooked up my Pro-38 handheld scanner and listened for a satellite pass. I was disappointed when I found that I couldn't hear the satellite with the fancy new antenna, but could hear it with the rubber duck antenna - Hmmm.....
I then checked the connections again and found the one of the feedlines to one of the dipoles had twisted and the shield and center conductor were touching, shorting out the whole thing (Something I'll have to fix to prevent!). By the time I fixed it there were no satellites for about an hour, but I was at least able to pick up the local 2m repeater with no problems, so I think it should be good for the next pass.
I don't expect much from the Pro-38, but hopefully I can hear the satellite pass and maybe get some kind of picture (crappy picture is ok for a first attempt with a narrow bandwidth radio!).

I'll post my findings when I see what happens in about an hour.

2183. ANNOUNCEMENT: ARRL and TAPR 19th Annual Digital Communications Conference

Newsgroup: rec.radio.amateur.space
Date: 2000-08-28 00:00:00 UTC
From: srbible@gate.net
Message-ID: <39aa76a6.229436382@news.gate.net>
Source record: 8467
Cross-posted to: rec.radio.amateur.digital.misc;,rec.radio.amateur.misc;,rec.radio.amateur.space

Notice:
September 1, 2000 is the last day to receive the special hotel room rate of $89/night single or double and the pre-registration price for the conference.

ARRL and TAPR 19th Annual
Digital Communications Conference
September 22-24, 2000 - Orlando, Florida

For more information see: http://www.tapr.org/dcc

Information
Mark your calendar and start making plans to attend the year's premier event in digital communications. The 19th Annual ARRL and TAPR Digital Communications Conference will be held September 22-24, 2000, in Orlando, Florida - just minutes from the Orlando International Airport.

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital expert, but also for digitally oriented amateurs of all levels of experience.

A Conference for the Beginner as well
The conference is not just for the digital expert. As in years past an entire session strand with beginning, intermediate, and advanced presentations on selected topics in digital communications will be offered. Some of the topics will include: APRS, Satellite Communications, TCP/IP, Digital Radio, Spread Spectrum and other introductory topics. Come to the conference and hear these topics presented by the experts!

Area Attractions
The Orlando Florida area is famous for its attractions and vacation spots. Disney World, Universal Studios, and Sea World (just to name a few) are within 15 minutes of the hotel. Shuttle service from the hotel will be available for a small fee. Cape Canaveral and Cocoa Beach are a 30 minute drive East of the hotel.

Symposia, Seminars and Banquet
Two symposia/seminars will be held which allow those with additional time and interest to make the most of the Conference. For those who may have interest in just one symposium or seminar, registration for the conference is not required to attend these activities. This allows maximum flexibility for those who may want to participate during the Digital Communications Conference, but do not have an entire weekend to devote to the event.

The Fourth APRS National Symposium will be held on Friday and will be moderated by Steve Dimse, K4HG (the developer of javAPRS). It will likely include many APRS software authors, such as Bob Bruninga, WB4APR (the father ofAPRS), Keith Sproul, WU2Z, Mark Sproul, KB2ICI (the developers of MacAPRS and WinAPRS), Brent Hildebrand, KH2Z (the developer of APRSPLUS), Mike Musick, N0QBF (developer of PocketAPRS), and other nationally known APRS leaders. Join this group for the afternoon and evening for in-depth discussions and presentations on the current and future status of APRS. This is a unique opportunity to gain insight into this fast-growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

On Saturday night the DCC Banquet will be held. A guest speaker will speak after the banquet and a prize drawing will top the evening. The Grand Prize is a Palm VII Personal Digital Assistant and Synergy Systems LLC has donated two M12 development kits and many more.

The Sunday morning seminar will be focused on PIC development, design, and programming. This five-and-a-half hour seminar will focus on the things you need to know now in order to understand and begin to participate in PIC development.

Co-Hosts
The 2000 ARRL and TAPR Digital Communications Conference local co-hosts will be:
Lake Monroe Amateur Radio Society
(http://www.qsl.net/lmars/),
Orange County ARES/RACES
(http://evcom.net/~jvoisin/ares.htm),
Seminole County ARES/RACES
(http://wwww.geocities.com/capecanaveral/launchpad/4773),
and Orlando Amateur Radio Club
(http://www.oarc.org/).

International Co-Hosts PRUG (Packet Radio User Group of Japan) will be the International co-host for a third year running. PRUG will be hosting an informal social Friday evening before their seminar and symposium is held. Visit http://www.prug.or.jp for more information about PRUG.

Hotel
Conference presentations, meetings, and seminars will be held at the Orlando Airport Marriott. It is highly recommended that you book your

room prior to arriving. A special DCC room rate of $89/single and $89/double per night has been blocked for 50 rooms and is available until September 1st, 2000. Once the 50 rooms have been reserved, room rates will increase. So be sure to book your rooms early! The hotel provides transportation to and from the Orlando International Airport. Please contact the hotel to arrange specific transportation needs.

Orlando Airport Marriott (conference hotel)
7499 Augusta Drive
Orlando, FL 32822
Phone 407-851-9000, Fax 407-857-6211
(http://marriotthotels.com/MCOAP/)

What you can expect at DCC 2000
- A full day of papers and breakouts for the beginner to the advanced
- Two seminars/symposiums
- The fifth annual Student Paper session.
- A banquet with Special Guest Speaker.
- Informal get-togethers throughout the weekend.
- TAPR Membership Meeting
- An event at which the most important new developments in amateur digital communications are announced.
- Digital 'movers and shakers' from all over the world in attendance.

There are few activities where your participation can be so much fun and important! What a great way to share and renew your enthusiasm for digital amateur radio! A get-together with colleagues and bringing each other up to date on your latest work -- all this, and more, for an unforgettable weekend of amateur radio and digital communications. We hope to see you at the ARRL and TAPR Digital Communications Conference on September 22-24, 2000!

Full information on the conference and hotel information can be obtained by contacting:

registration form and payment.

2184. Is ICOM going to come out with a new Satellite radio?

Newsgroup: rec.radio.amateur.space
Date: 2000-08-28 00:00:00 UTC
From: Rob Kling <rkling@home.com>
Message-ID: <G5vq5.18167$QW4.222524@news1.rdc1.mi.home.com>
Source record: 8468

I have checked the ICOM site several times and it appears to be nothing to replace the IC821H. Can anyone speculate or do we settle for the current state of satellite technology. If there is something new I hope it would do 9600 bps-better and have the higher frequencies(>440) such. It would even be nice to have a few DSP modems built into the unit or at least have the ability to have third parties write the DSP codes and we just upload the ones we need. It gets somewhat tedious to switch all the time between HF and VHF and satellite modes. I just bought another TNC so that I do not have to switch. With the current state of technology there is so much more that can be done in the radio that it now makes sense to do so!

Congratulations! You can see how handy it is to record
the pass and play with it offline until you get it right...

Some things to try, in order of generally decreasing
desireability:

- check the decoding settings in wxsat - there is one for
Meteor, whose carrier and sync frequencies are
different from the NOAA satellites.

- Does wxsat sync to the image (the "sync" numbers at the
top of the window)?

- have you tried manual sync?

- have you adjusted the PLL parameters in the synchronous
detector (usually only needed for tape-recorded passes)?

Conformity magazine's online update (http://www.conformity-update.com/) reports the World Radio Conference has acted with regard to spectrum assignments. Among other things it has assigned the complete 1215-1300 Mhz range to the GPS L2 band (see http://www.spectrum.ieee.org/special/wrc2000/index2.html)

Looks like we just lost 1.2 GHz.

The SPECTRUM article ends with:

"In all, claimed ITU Secretary General Yoshio Utsumi in a concluding press conference held this morning, 'This was the most successful conference of the ITU held so far.'"

Not for us!

Cortland

That band has always been shared with radio-locating. We haven't lost
anything.

"(h) No amateur station transmitting in the 23 cm band, the 3 cm band, the
24.05-24.25 GHz segment, the 76-81 GHz segment, the 144-149 GHz segment and
the 241-248 GHz segment shall cause harmful interference to, nor is protected
from interference due to the operation of, stations authorized by other
nations in the radiolocation service."

> Congratulations! You can see how handy it is to record
> the pass and play with it offline until you get it right...

Yes! This is fun stuff, even with the crappy receiver I have at the moment. I can see there is an image in there, some of it looks like it could even be fairly clear, but I just have to twist it a bit to get it out.

> - check the decoding settings in wxsat - there is one for
> Meteor, whose carrier and sync frequencies are
> different from the NOAA satellites.

Yes, I have learned that there are some things with the Meteor that are different from the others. I have been looking for stuff one he internet about that satellite and have learned that this problem is kind of a common one. I also downloaded the .ini file from this site: http://www.drdale.com/cam/wxsat/index.htm and tried his settings out.

> - Does wxsat sync to the image (the "sync" numbers at the
> top of the window)?

Not sure about that, I'll have to look at that and see what it says.

> - have you tried manual sync?

I tried that when I was receiving the image live, but haven't tried that with the .wav yet. Do you just click the Manual sync after you start the decoding?

> - have you adjusted the PLL parameters in the synchronous
> detector (usually only needed for tape-recorded passes)?

I think this falls into the settings that I don't understand what they mean yet. I'm sure I fiddled with them a bit not knowing what I was doing.

Source record: 8475

You're Wrong. You made a retards mistake on field-day. You losers showed up at field day planning to make only one or two satellite contacts which is totally contrary to field-days purpose.

That's the right attitude, and that's what i did last year. I actually made the first contact for our group, Alaska from the greater SF Bay Area (and eventually worked the same station in the dead of the night on 20M) I don't remember if i was running 1W or 140mW, but on Pacific passes, that's what i often run, into a homebrew hand-held antenna. No doubt, all of the transcontinental passes were total mob scenes, with everyone walking over each other, but there weren't even a half-dozen stations on for that pass, so i worked a couple of others so they got their bonus points. So, yes, you can win with power, but you can often win by cleverness as well.

The HF side of your group
didn't show up at field day only able to work one band, why did you show up at field day only able to work one type transponder? It's because you're a Loser and someone needs to take a black felt marker and write the word "RETARD" on your forehead. My advice: When you go to field-day next year, you need to set up an oscar station and plan to work as many stations on as many different satellites as possible.

On field day, one contact is sufficient (unless you're able to work AO-10 or equivalent). TThat's hy the first contact carries lots of points, and the additional ones count for no more than a terrestrial contact.

Under such circumstances, satellite resources are very valuable and should be used sparingly and appropriately.

year, you need to set up an oscar station and plan to work as many stations on as many different satellites as possible. That's the whole point of field-day.

No, the point of Field Day is to show what we can do with a minimum of preparation and in a manner which simulates an emergency. Under such circumtances, yes, you want to handle as much traffic as you can, under marginal conditions and with improvised equipment. And demonstrate you can utilize a satellite if you really needed to.

If you have the equipment to work one of the big birds (AO-10 or soon, P3D), or one of the linear LEOs (FO-20, FO-29, or RS-13), please, PLEASE stay off of the FM satellites on Field Day! Please leave them for those who can't afford a fancy station, or maybe are operating in spirit of Field Day, with portable or minimal equipment.

And to return to the earlier topic of discussion. I just got onto UO-14, probably on a few watts (no meter handy), and it's been so long i had to

look up the frequencies. Again, a Pacific pass with a modest number of people on, all very well behaved. So, those of you west of the Rockies, try a late evening pass on UO-14; you might be surprised. But you are right that transcontinental passes on weekends are usually quite a zoo, it's been that way for years.

-- KD6PAG (Networking Old-Timer, satellite QRPer)

P.S. REMINDER: Please don't try to operate on AO-27 until they're done diagnosing its recent reboots and successfully upload its normal operating software. If you don't transmit until you can at least copy callsigns, then you stay out of trouble and won't make the most common mistake seen on the FM birds. Persistent stations with 'no ears' have been far more disliked than nearly all of the alligators on AO-27.

That program does do a good job. I tried it but it doens't seem to
figure out what kind of satellite signal it is. I set mine up to
decode the Meteor signal, but then it says it has some problem and asks
if I would like to continue with the NOAA settings. I click 'yes' and
it does something, but then nothing shows up.

I'm thinking that my recording might not be that good since I am
loosing a lot with the narrow bandwidth of the scanner?

From: tegwilym@my-deja.com
Message-ID: <8ohdur$ec4$1@nnrp1.deja.com>
Source record: 8481

I am thinking of doing the .01 uF thing to my old Pro-38 scanner to try to widen the bandwidth for the APT satellites. The IF filter appears to have 3 pins on it, I'm assuming they are ground, input and output? I'm assuming that the cap goes across the input and output where the IF filter was plugged in?

I should also be getting a Bearcat 210 scanner that I will try to modify also for this using the info I found on the web, but since the pro-38 already can receive them, I thought I might try to modify this one also.

Any advice???

Thanks,

Tom KA7VIK

Hey Jim,

I use a VX-5R from Yaesu with a Comet SMA-24 antenna and I have been able to listen to UO-14 a number of times. I have not actually tried to transmit yet. I am still getting the hang tracking the satellites.

The VX-5R has a neat function. It has a spectrum analyser built in. This allows you to monitor the frequencies above and below the nominal downlink. It makes it easier to see when the satellite is in range. Then I shift over to my preprogrammed uplink/downlink freqs that compensate for the doppler shift.

Source record: 8484

It took a lot of screwing around, but I finally worked out an image.
Nothing very pretty, but at least you can see there is some ocean, clouds
and land in the picture. I just have to figure out how to get rid of the
wavy mess in the picture.
I also pulled out the IF filter and put in a .01uF cap in the Pro-38
scanner. I haven't had a good satellite flyover since I did that, but I can
still receive with it, so I know I didn't destroy anything too critical!

I put my first attempt on a web site here:
http://tegwilym.homestead.com/index.html

Comments are welcome -- even bad ones!
:-)

It appears that our hamsats are failing faster than they are being replaced. All the JAWSAT group failed. In the last two years or so, we've lost RS10, RS11, RS12, AO21, AO13, AO21, AO27?, and AO10 tumbling, with FO20 and UO14 partially crippled. If P3D doesn't make it up successfully , the amateur space program may be doomed in a matter of only a few years.

In London Ontario Canada...

London Amateur Radio Club has another hamfest on the way. This is expected to be the biggest and best ever at our new location! Computers, radio equipment and electronics flea market. See the web site for more details.

Lot's of free parking! Food on site! Vendor tables filling fast!!!
Reserve tickets early! Slots next door!

LARC HAMFEST 2000
SUNDAY, SEPT. 24TH
9:00 AM TO 1:00 PM
VENDORS SETUP 8:00 AM
ADMISSION: $6.00, TABLES: $8.00

More details at http://www.larc.on.ca

Rick,

AO-27 will return most likely, UO-14 is NOT crippled, FO-20 works great and AO-10 works pretty well most of the time. You have to remember that we are no replacing them at a regular rate.

2209. Latest progress on my satellite project....

Newsgroup: rec.radio.amateur.space
Date: 2000-08-31 19:06:40 UTC
From: tegwilym@my-deja.com
Message-ID: <8omabf$6it$1@nnrp1.deja.com>
Source record: 8493

Ok, I'm starting to figure this stuff out better now. I just posted 2 more images on the web site: http://tegwilym.homestead.com/

These didn't turn out that well, but at least what is visible isn't all twisted like the Meteor image. Also the mod I did to my scanner seems to work, the audio from the satellites sounds a lot better and actually sounds like the samples I have found on the web sites!

I'll have to check if the nulls in the image are happening when the satellite is directly overhead, so maybe my dipole phasing is backwards?

I set up my computer to record a good high pass of Noaa-14 this afternoon while I'm at work, so hopefully I will come home and find a good signal to process!

Question: if the audio is too low, would that cause the images to come out kind of gray looking?

Source record: 8494

Hi,

I am trying to locate a Science of cambridge (Later to become sinclair) Mk14 computer. The computer was available in a home built kit in the UK and, from what i am led to believe, many were sold to amateur radio enthusiast, as, at this time they were the only people experimenting with electonics in the home build environment. (Hence my reason for posting in this group)

If you have one, or any spares, or indeed any sinclair items ie radios, calculators, watches, etc, working or otherwise, that you would like to sell please email me as i cannot regularly access newsgroups.

I would also possibly be interested in early home computers from the late 1970 to the late 1980s. Preferably boxed but all will be considered.

Thank you in advance.

This is very tricky to get right. You can spend an hour making twisting
movements with our hands, reasoning, and looking in a textbook all the time,
and still get it wrong on the first try. And you already have a 50-50
chance of getting it right when you don't even bother to check it.

Remember that even NASA engineers made this mistake on one of the first
TV satellites.

However, there will always be nulls. Where they are depends on the
distance from the reflector (for a crossed dipole) and on the antenna type.
Equal gain from horizon to zenith is difficult to achieve.

Rob

I have a feeling that I have my antenna phased correctly. That one first image I got from the Meteor satellite is pretty clear most of the way through (even considering that the receiver is narrow band, no pre-am on the antenna, and the picture is warped).
http://tegwilym.homestead.com/
I'm still trying to get another good recording so I can see if the scanner mod works ok. Yesterday I had the computer all set up to record a few good NOAA-14 passes. When I got home I found to my horror that I forgot to plug the audio cable into the computer! D'oh!!!
I had about 14 megs of nothing recorded. Oh well....
Last night I tried using a desktop computer instead of the laptop, for a good high angle pass this morning. Something didn't work right again since I got a little bit of image of the edge, but everything else was just black, the recording didn't sound very good either. Strange, since it was at least 80 degrees above the horizon.

What do most people use to record the signals with? Tape recorder? Computer?

I have been using the Satscape software and pick out the best satellite passes and just set it up to record one satellite. When it's in range it will automatically download it to a .wav file. Maybe when I get a pre-amp on the antenna, I'll get a better signal so I can set it to scan all the freqs and then lock on to one as it comes over. I just don't have enough signal strength right now to break the squelch reliably.

The quest for good pictures continues.....

Tom

What was the local time? Visible images are always dark, even
in mid-summer, while IR images always look light and washed out.
This is well documented - e.g. Taggart. I use gimp to tweak the
gamma curve to show me detail in otherwise-black (or white)
pictures.

> What do most people use to record the signals with? Tape recorder?
> Computer?

I've always recorded directly to the computer. That way you get
accurate, crystal-controlled recordings. An analogue tape
recorder that is sufficiently stable to do satellite images
justice will be hard to find, and it will be expensive. DAT
would have been ideal, but it never really took off.

> I have been using the Satscape software and pick out the best

Language point: "download" connotes digital protocol activity.
You are recording signals. For now, I wouldn't worry about
timing - eliminate a variable by recording passes live when
you're at home.

> ...Maybe when I get a
> pre-amp on the antenna, I'll get a better signal so I can set it to

You need a better antenna. NOAA-14 was full-quieting this morning
(0700 local time) on my Pro-43 with a rubber duck. A preamp
will increase the range of elevations over which the satellites
are full quieting. It won't magically bring the signals up out

of the noise.

If your domestic situation makes antennas impossible, and you're not prepared to move, consider a portable system: take a radio, antenna and tape recorder to a parking lot or park or something, record the signals, and then bring them home for processing.

> The quest for good pictures continues.....

Good luck. While I applaud your enthusiasm, you're trying to do too many things at once, and need to be a little more patient about it.

So do the analog recorders just vary too much in the speed they play?
Do you have any problems with computer noise getting into the radio
when recording? It seems that the Micron laptop I have been using is a
lot quiter than the desktop computer I tried last night.

> Language point: "download" connotes digital protocol activity.

Sorry, I've been into computers too long! Just getting back into radio
stuff again and find myself crossing terms incorrectly. :-P

> You need a better antenna. NOAA-14 was full-quieting this morning
> (0700 local time) on my Pro-43 with a rubber duck. A preamp
> will increase the range of elevations over which the satellites
> are full quieting. It won't magically bring the signals up out
> of the noise.

I do understand that the amp won't pull signals out of the noise. I'm
mainly want to boost them a bit and get a lower shot at the horizon.
Do the amps act as a bandpass filter at all and block anything on the
sides? I'm assuming it probably doesn't.
Also I think I should work on my BNC connectors, I used the twist on
type and I know those can't compare to the solder type. One of them
was from Radio Shack and that one just about fell apart when putting it
on. Radio Shack sure hasn't improved at all over the years.

> If your domestic situation makes antennas impossible, and you're
> not prepared to move

Someday I would like a house, but for now I'm stuck in the condo. It
isn't too bad, I have 2 floors and a large patio where I can put the
antenna.

> consider a portable system: take a radio,
> antenna and tape recorder to a parking lot or park or something,
> record the signals, and then bring them home for processing.

Yeah, my antenna can easily come apart and fit in something like a tent pole bag.

> Good luck. While I applaud your enthusiasm, you're trying

Yeah I know! I just get kind of excited when I discover something new and facinating.

This will teach you how to work with satellites... at least if you do mind the lost time.

A decade ago, I was writing software to download files from UO-14 (the satellite that was now released as an FM repeater, it was a digital BBS in its first life!). I had to write some code, wait for the satellite to come over, discover within 10 seconds that something was seriously wrong, and then the remainder of the pass was usually too short to fix it and try again.

So, again wait for the next pass (1.5 hours) for the next try. This of course all on rainy sundays, as on weekdays more than half of the passes occur during working hours, dinner time, or bedtime. You got maybe 2 or 3 usable passes on a weekday.

I can assure you that this helps in getting things right the first time. (one is forced to pay attention to details as simple as "audio cable not plugged in")

So, you can either work in a very disciplined way (test and check everything) so that stupid little mistakes don't occur too often, or alternatively you can do it the easy way and just relax when something went wrong and hope you have better luck next time, without worrying to much about it.

Yeah, I have been spending a lot of time figuring this stuff out. I have been setting it up to record during the day when at work using the Satscape software, then run home and see if there is anything good on the hard drive. Hopefully not a large chunk of wasted hard drive space!

I did order one of those Pre-amps from Hamtronics the other day, so hopefully that shows up next week. I still can't seem to get any images that look as good as the first warped image I got from the Meteor 3-5 last weekend, but I continue to try and fiddle around with stuff.

I did put a photo of my antenna on the web page last nigth, take a look!

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.space,rec.radio.amateur,rec.radio.swap,rec.radio.amateur.swap

Thank you for reading my message today.

I can not remember the e-mail address for a list server I was on from Sanford University. Too many HDD crashes I guess. If you know the e-mail of the W6(YZ@stanford.edu?) Mail list please forward that address to me please. I would like to say my good bye's to those on that listserver as well.

Name here is Michael David Hiltner
Call is VE3VRQ (AKA: CF3VRQ), No doubt, I have QSL'd with many on 2m & 6m SSB!
Grid is FN13gx

I will be departing for Saudi Arabia on the 20th of this month, and have been notified that I will not be able to bring over any of my radio equipment into the country.

Since I will be there for 5 years, I have decided to liquidate my Amateur Radio Equipment Holdings. There is one station for intl radio users (about 300km from where I will be stationed), I intend to visit this QTH as much as possible.

Remember These items WILL be sold to the BEST OFFERED PRICE. There are only 18 days prior to my departure, so please Print &/or FWD this message to as many Radio Amateurs you know to get the widest exposure. Time is of the utmost importance. Do NOT hessitate on this offer! They WILL be gone before too long.

Items:

o Yaesu FT221r 2m
o Yaesu FT736r 2m / 440cm
o Mirage A1015g 100w 6m Amp
o GC Electronics 6m SWR & Power Meter
o General Electric (Shure Brothers) mic w/ 600ohm mic modification (This is what gave me my crystal clear transmitions on both my FT221r & FT736r!).

Buyer assumes the responsability for shipment / insurance of all of the above items.

Mailing address for your cheque:

Michael David Hiltner
VE3VRQ
18993 Loyalist Parkway

R.R.#3 Consecon, Ontario
K0K 1T0
Canada

Thank you kindly for your time & QSO's! I have enjoyed each and every opening I have been able to muster!

73 my friends! de, VE3VRQ, Michael

The first thing you will have to realize is that no dream station will
compensate for lack of experience with the basic stuff. When you don't
want to waste your time getting familiar with manual controls, insensitive
receivers, not-quite-good-enough antenna's etc it is better to forget the
entire operation than to try and build the dream station on the first try.

Besides that, you will find that all the fun basically ends when you have
tweaked the last imperfection out of the station.

Suggest that you should take a look at http://www.rig.org.uk
this site is devoted to weather satallite signal reception
and the interpretation of the pictures.

RIG (Remote Imaging Group) is UK based but has members in 51
countries, their magazine, 6 issues a year, is well worth a
subscribition.

Also, take a look at http://www.egroups.com they host mail
lists. One such is rig-l (nothing to do with RIG
officially, see the archived postings) The archive has a lot
of interesting info.

A group based in the Netherlands http://www.kunstmanen.nl is
well worth a look at.

Cheers,

I can confirm the psychedelic swirls from Meteor 3-5, after
grabbing a pass Saturday morning. Looks like it's blown a
fuse too. Sigh.

Meteor 3-5 was always good for spectacular images, being
in a much higher than usual orbit, but still sith strong
downlink signals.

>
> Jeff
> N8EIP

My mistake on UO14 Jeff...I didn't mean to include that one in the group. However, I often work (attempt) AO10, and find that it's utility has dropped significantly in the past year....it is barely usable at all, and usually less than 20,000 slant range out. The tumbling has caused much weaker signals than we used to have. For all but those with all the the most sophisticated OSCAR arrays, this one is pretty much useless now.

As for AO27....time will tell. DO17's problems started out the same way, and quickly gave way to total failure.

Bottom line: We desperately need a successful launch and operation of P3D.

Rick T.

: hams
: on the ground? ...

Most probably, yes. According to Sven Grahn's Space Radio Notes
at http://www.users.wineasy.se/svengrahn/radioind/radioin1.htm
several spacecraft have used shortwave communication when they
were "out of sight" of the ground station, mainly on frequencies
around 15, 18, and 20 MHz.

There are also allocations for amateur radio space communications
in the 28 MHz, 21 MHz, and 7 MHz bands, although it seems that the
latter haven't been used yet.

Some decades ago I monitored a transmission from a Gemini capsule on 15.016
MHz (direct) talking about an oxygen problem. I think I was out in the field
with my unit, and used intercom wire between commo vans as an antenna for
the GRR-5 receiver.

Well, just consider how RS-13 works.......... uplink on 15 meters, downlink
on 10 meters. There's your answer.

With my temporary antenna setup, not really. :-) Plus, I can't remember if the
Meteor birds transmit in darkness.

It's very likely to be AM. It's right in the middle of the aviation
Air/Ground band, which is all AM.

When did you last hear it?

The robot ran lots on RS-10, but I don't recall ever
hearing it on RS-13.

The book "Monitoring NASA Communications" lists 126.3 MHz as AM. It's
listed in this book as Shuttle landing VHF tower communications.

2252. Use Palm computer for logging?

Newsgroup: rec.radio.amateur.space
Date: 2000-09-09 23:02:58 UTC
From: Chuck Wyatt <cwyatt@webmaster.solidworks.com>
Message-ID: <8pefhs$6ap$1@bob.news.rcn.net>
Source record: 8536

Just curious if anyone uses something like a Palm Pilot or other hand held computer to do radio logging? My station is currently set up a distance away from any household computer equipment, and it occurs to me that perhaps the answer is to get a hand held portable to log contacts.

Thanks!

Chuck

They DO make a log for the palms. Check palmgear.com and do a search
for ham radio or amateur radio. There's a program called HFlogger.
I use a Handspring Visor deluxe but haven't tried that program yet.

2254. Wxsat scanner bandwidth mod question.

Newsgroup: rec.radio.amateur.space
Date: 2000-09-10 01:28:42 UTC
From: "Tom G." <tegwilym@wolfenet.com>
Message-ID: <PsBu5.271$k_.5781@den-news1.rmi.net>
Source record: 8538

I was down at a hamfest this morning and picked up a Pro-2038 scanner for $50, good shape and never had been used, still in the original packaging!
Anyway, I am now working on modifying it for the satellites and on my first attempt was somewhat pleased with the results. See image here: http://tegwilym.homestead.com/files/09091246.jpg
I got a lot more North/south coverage as you can see, and a lot less noise than with the other scanner. I bypassed the IF filter with a .01uF capacitor and hooked it up with a swtich that I could turn on and off to hear the difference. It is working since the signal is a lot clearer sounding with the cap in the circuit than without. From the looks of the image I think I need just a bit more bandwidth to pull the white of the clouds out rather than the static that shows in the image.

Ok, now you see what I am doing here is my question:
When trying different Capacitors to increase the bandwidth which way should I go? I have a .01uF in there now and want to go wider, do I put in a bigger or smaller capacitor? I just installed a little socket in there so I can quickly test different ones. I have about an hour before another Satellite pass, so I thought I would ask for some advice.

Thanks again for all your help!

Tom

The value of the capacitor has very little to do with the bandwidth. It simply replaces the narrow filter just as a piece of wire would but keeps the DC voltages seperate between the stages. If you removed the filter and are just using the capacitor you should have plenty of bandwidth for the sat. About all that will hapen if you go too low in value with the capacitor is the signal level will drop off.

It may be the first filter is too narrow but if you try the capacitor bypass on it you will not have much selecitivity at all and will be hearing to many undesired signals.

Thanks, Tom! Here's a newbie question for you. I see that HF Radio
Logger requires Palm OS 2.0. Now can I get that OS in something earlier
than a Palm V?

Ah! Ok.
On my other scanner Pro-38, I pulled out the filter and put a .01 uF cap in its place. For this new scanner, I was reading a web page on modifying some of the Radio Shack scanners and the guy wrote that you could put a capaciter as a by-pass around the filter, and still keep the filter in place. I guess that didn't work as well as I had planned. I guess I'll try to pull out the filter and try some different capacitors in there and see if I can be as successful as I was with the other scanner.

I think putting the capacitor in parallel (bypassing the filter) it did widen the bandwidth slightly since I could hear more of the signal clearer. I tried a whole bunch of them frantically swapping them as fast as I could durning a few short 10 minute passes.

The filter in this radio has 5 pins on it. Kind of like this:

```
----------------
I 0 0 0 0 I
I I
I 0 I
----------------
```

I am assuming that the top right and bottom left pins are the input and output. The other 3 on the left were all connected together and were soldered onto a wide trace on the board. I just took a guess and figured that was the ground and have been playing with the other 2 pins. I don't have a schematic for the radio, so I'm just going on what I can figure out by looking at the traces on the board.

You were talking about a switch. That is probably your problem. You need
short wires, not a long wire going via a switch.

Remove everything (switch, filter) and solder the .01uF cap in the two
holes that connect to the signal trace, pushing the component down as far
as it will go without applying excessive force that might break it. Cut
off the excess length of leads protruding through the board, and solder.

Tom,

I tried this modification to my scanner and it never did work as well as everyone else claimed. My suggestion would be to purchase the Weather Receiver kit from Hamtronics. I think it costs anout $139 in kit form and is easy to build and align. I also comes with all 5 common freq crystals for the WXSAT's. For all the trouble I went to trying to modify my scanner this kit was well worth the $$$.

Good luck and God Bless
Chuck

Not sure, are you sure it didn't say OS2 or higher? I haven't had
time to check that out. I would think it would run on a new Palm..

yeah, I was kind of concerned that the swtich might be causing some trouble.
Anyway, I pulled out the IF filter last night and put the .01uF in its
place.
From the look of the image (and sounds of the signal) I think I got the
bandwidth I need now. The latest picture I copied with the new radio is the
"New" on at http://tegwilym.homestead.com/
Looks like its working well so far, the new radio has obviously lowered the
horizons now!

Pre-amp is next.

2265. Need Recommendation for 2M Amp

Newsgroup: rec.radio.amateur.space
Date: 2000-09-11 02:48:06 UTC
From: <>
Message-ID: <8phh56$h81$2@pyrite.mv.net>
Source record: 8399

I am looking for a source of a reliable 2 meter amplifier that can output 150-200 watts with a maximum drive of 50 watts. I Purchased a Mirage 5016 and 5 minutes into it's life it failed the smoke test. I opened it up and found there were components hanging off the PC board. I returned the amp and picked up a replacement, removed bottom cover and visually inspected for loose components or shorts, hooked it up and monitored input drive power, output wattage and SWR and DC operating voltage. It worked with light duty this weekend till while holding a short CW QSO during a low horizon satellite pass It started smoking and failed. Being kind of burnt out (pun intended) on MFJ Mirage products I would really appreciate a recommendation on a reliable 2 meter amplifier.

Any help would be appreciated.

What exactly failed in the amplifier? I know a few people who have Mirage
bricks, and they don't seem to have a problem with them. If nothing else
they shut down on high temperature. A small box fan on the heat sink takes
care of this.

19th Annual ARRL/TAPR Digital Communications Conference
Orlando, FL - September 22-24, 2000

** Update 9/11/2000 **

A little more that one week away, the 19th Annual ARRL/TAPR Digital Communications Conference is about to begin. For detailed information about the conference, please visit the official DCC web page at http:www.tapr.org/dcc.

Registration for the conference will be taken at the door. Friday registration is for an entire afternoon APRS activities, demonstrations, and presentations. Saturday registration includes conference proceedings, lunch, and a full day of presentations. Saturday night includes Banquet, dinner speaker, and prize drawing. Sunday registration is for the PICmicro Design seminar.

Banquet Prize Drawings:
Grand Prize - Kenwood TM-D700A (donated by Kenwood)
2nd Grand Prize - Palm VII Personal Digital Assistant
Two Motorola Oncore M12 GPS Evaluation Kits (donated by Synergy Systems, LLC)

Map and coordinates:
A map of the conference hotel and coordinates are available at ftp://ftp.tapr.org/dcc/dcc.hotel.map.pdf

Speakers:
The following is a list of presenters. Preliminary schedule is available from ftp://ftp.tapr.org/dcc/2000.dcc.schedule.pdf

APRS Seminar - Friday September 22, 2000

John Ackerman, N9UR APRS WG
Steve Bible, N7HPR T-238 Weather Station
John Blowsky, KB2SCS APRS LOOKUP
Steve Bragg, KA9MVA HamHud
Bob Bruninga, WB4APR APRSdos, satellite, etc.
Steve Dimse, K4HG Internet APRS
Walter Dunckel, KD6VYV Serial Control of D7/D700
John Hansen, W2FS KISS TNC, D700 Keyboard
Dale Huguley, KG5QD Weather Server
Larry Gahagan, AB0JM Wildfire Support
Byon Garranrant, N6BG TinyTrack
Mike Musick, N0QBF PalmAPRS/Tracker construction
Robert Osband, N4SCY Public Service with APRS

Tom Schaefer, NY4I APRS Email Gateway
Darryl Smith, VK2TDS APRS in the 2000 Olympics
The Sprouls, WU2Z/KB2ICI Mac/Win/XAPRS
Rob Wittner, KZ5RW APRS-CE

Main Session, Paper Presentation - Saturday 23, 2000
Titles and abstracts are available at

Once you have the IF bandwidth sorted, the next issue is
the bandwidth of the radio's discriminator - which is why
you don't see any IR images (lots of white, and they look
awful!) on my web page. I don't consider it worth the
hassle to further mess with the radio...

Message-ID: <39BD5F99.47B9F1F8@mac.com>
Source record: 8407

What component smoked this time? Was it in the
input, power supply, or output section? I use RF Concepts
and have had no problem with a 100watt 70cm amp, but
I don't have anything in the 150W+ range. Are you using
"hardline" keying, where the amp stays keyed during your
transmission, or are you
relying on the automatic relay in the amp? (the latter is known
as "full QSK" is it not?) I can see how switching the thing
between rx and 200w tx at cw speed could be a bit hard on
the thing...

Curious

I think that the shuttle is currently docked with ISS Zvezda module, but my tracking SW shows them in different locations (although moving along the same path). I'm using Nova for windows and have downloaded the keps from the FTP site that Nova uses. How can I tell the correct location? I would think they should show on top of each other.

Thanks,

Rodney

Go to http://liftoff.msfc.nasa.gov/Realtime/Jtrack/3D/JTrack3D.html.
This will generate a track for all the satellites in an Applette window
in 3D. Select the satellite that you want and you can follow its obit.
Once the window has opened and you have selected your satellite, click
view and click orbit path. Under options, select select update rate
1/4 second, and under timing, real time. As I write this, the shuttle
has just crossed the equator on a decending orbit south south east of
Hawaii. If you start at http://liftoff.msfc.nasa.gov you will find a
lot of neat stuff about the satellites and space programs. Good luck

I have today set-up a Cross Dipole antenna for Connection to my PCR-1000 so
I can download WXsats, I have no trouble with these.

Could somebody tell me what Amateur Sats are audible in the UK so that I can
listen to them.

I have all the relevant Software for tracking etc, but am unsure which Sats
to listen out for.

I have heard the RS sats on 29 MHz, but nothing on 144 or 432 MHz.

Many Thanks

Try looking at www.amsat.org This is a page that has all the Amateur
sat data on it.

There is a description of each one that is in orbit and also the
tracking data for them.

Most if not all the ham sats are in an orbit that should cover the whole
earth at some time. All but one is in a low earth orbit so you should
be able to hear many of them is the receiver you have will receive
single sideband. There are a couple that use FM and some that use other
digital modes.

I hate to cross post like this but I think the topic of this mesage warants it.

Has anybody tried to build a basic radioastronomy setup with cost minimization in mind?

I (and possibly some other people, if I can convince them that this can be done cheaply) am looking to build a small setup to do drift scans on the neutral hydrogen line around 1420MHz. The catch is that we are students and as such, we do not have a great deal of cash on hand. Our key problem is the lack of cheap recievers in that frequency range. I've only found 2 and both are $2000+. Can anyone offer some suggestions?

As for the rest of the equipment, between whatever money we can scrounge up and our talents as a bunch of engineering students, I think we have it covered.

Good references on the subject of rolling your own radio astronomy setup and any other thoughts would be appreciated.

Thanks,

I recommend the VHF-UHF manual by Evans and Jessop. They give
instructions for building everything yourself.

Might I ask why you've chosen the 21 cm line? If you're not planning on
imaging (because you're doing drift scans which don't allow you to
integrate very long to improve your signal to noise ratio and you're
probably not going to use a multiple channel setup to accomodate the
doppler shift of the hydrogen you will be measuring) then what do you
expect to actually "see"? If it turns out that the 21 cm line is too
faint to be detected by your setup, don't despair because there are a
lot of bright radio objects out there that you should easily see in a
drift scan with a reasonably sized dish. The brightest sources in the
3rd Cambridge catalogue such as Cygnus A and Cassiopeia A are good
targets as is the galactic center, Sagittarius A*.

Amen. I was a confirmed pocket calendar man until I bought a Visor deluxe
with/8MB memory module six months ago. I'd be lost without it now.

2292. UHF mast mount preamp suggestions?

Newsgroup: rec.radio.amateur.space
Date: 2000-09-15 00:00:00 UTC
From: N7CXI@SiliconPixels.kill.this.com
Message-ID: <qSww5.32$_Q.58932@den-news1.rmi.net>
Source record: 8426

Hello folks,

I'm looking for suggestions for a top-quality 70cm mast-mount
preamp, with the following features:

Will accept feedline DC power and switch from FT-847
Low noise figure, good dynamic range. (of course! :-)
Will handle at least 50 watts "pass through"
Has reasonable front-end selectivity, pass 432-437
Rugged mechanical and electrical construction

Also, adjustable gain would be ideal, but that
usually means trade-offs in other areas.

Any ideas?

Thanks,
Jim Barber, N7CXI

Hi Chris
We suggest downconverters for several reason ... lower frequency will have less sig lost to shack and receiver ... Look at Amateur Radio Astronomy page ... they have some Hydrogen line items for sale .. good luck pete smith

2295. QFH antenna -- first images.

Newsgroup: rec.radio.amateur.space
Date: 2000-09-18 00:00:00 UTC
From: tegwilym@my-deja.com
Message-ID: <8q5h65qfu1@nnrp1.deja.com>
Source record: 8430

I just built a QFH antenna this weekend and have a few images from it so far. Nothing too exciting yet, but I can tell that it is probably working better than my turnstile antenna since the deep nulls seem to be gone. I just have some static crap to deal with now. But it looks like the images I got so far are quite clear compared to what I had before.
The antenna is one of the shorter versions (about 2 feet tall) and I put it up in my attic. I was planning on hanging it from the beam at the peak of the roof, but then realized that the attic was shorter than I estimated. I just plopped the antenna down in the far corner of the attic standing it in a pile of insulation. I tried it just inside my attic door, but got all kinds of noise. Thinking it may be from the computer, I moved it as far as I could go away from the computers and put it near the outside wall near an air vent. It should have a little better southern view now and the antenna is up about 25 feet off the ground now too. I seem to pick up a bit more noise now, I noticed a couple times that I could hear some voices (From the nearby airport? Pagers?..not sure). It wasn't too bad so I'll keep testing and see how it works out!

19th Annual ARRL/TAPR Digital Communications Conference
Orlando, FL - September 22-24, 2000

** Final Update 9/18/2000 **

Counting down the final days until the 19th Annual ARRL/TAPR Digital Communications Conference this weekend in Orlando, Florida. For detailed
information about the conference, please visit the official DCC web page at
http:www.tapr.org/dcc.

Registration for the conference will be taken at the door. Friday registration is for an entire afternoon APRS activities, demonstrations, and
presentations. Saturday registration includes conference proceedings, lunch, and a full day of presentations. Saturday night includes Banquet,
dinner speaker, and prize drawing. Sunday registration is for the PICmicro
Design seminar.

DCC Social:
Please join us Friday evening at 7:00 PM for a social get together time.
The social is generously hosted by the Packet Radio Users Group of Japan
(PRUG).

PRUG Presentation:
Friday night the Packet Radio Users Group of Japan will present talks on
their progress on high-speed digital networks in Japan.

Saturday Night Banquet Speaker:
Mr. Doug Campbell, of Triton Network Systems
(http://www.triton-network.com)
will be our DCC Banquet Speaker. Triton Network Systems is located in Orlando, Florida.

Vice President Product Management, Marketing, & International Business as
Vice President of International Sales, Marketing and Product Management, Mr.
Campbell leads the assessment of global community needs and spearheads

the
development of Triton Network Systems' product and marketing
strategies.

Mr. Campbell cultivated his management skills in sales, marketing and
product development working 17 years for Nortel Networks. While based
in
Singapore, he built a multifunctional pan-Asian team, which
successfully
captured a 100% market share with MCI-WorldCom Asia, successfully
introducing a number of new products. Prior to this, Mr. Campbell was
instrumental in the establishment of an SDH broadband equipment joint
venture in China and served as a member of the company's Board of
Directors.

Mr. Campbell received a Bachelor of Engineering Physics degree from
the
Royal Military College of Canada in Kingston, Canada, and a Master of
Business Administration from IMD (University of Lausanne) in
Switzerland.

Banquet Prize Drawings:
Grand Prize – Kenwood TM-D700A (donated by Kenwood)
2nd Grand Prize – Palm VII Personal Digital Assistant (donated by
TAPR)
Two Motorola Oncore M12 GPS Evaluation Kits (donated by Synergy
Systems,
LLC)
Microchip PICSTART-PLUS PICmicro Programmer (donated by Microchip)

PIC Seminar Prize Drawing
Microchip MPLAB-ICD (donated by Microchip)

Project and Demonstration Room:
The DCC is a place where people can talk about their projects and gain
ideas
for new ones. The Project and Demonstration Room has become a recent
DCC
tradition where people can bring and display their projects. The room
will
be located next to the registration room and across the hall from the
main
presentation room. The Project and Demonstration Room will open at
registration time and be closed (locked) 11:00 PM Friday and Saturday
night.

Map and coordinates:
A map of the conference hotel and coordinates are available at
ftp://ftp.tapr.org/dcc/2000.dcc.hotel.map.pdf

Speakers:
The following is a list of presenters. PDF version available from

ftp://ftp.tapr.org/dcc/2000.dcc.speakers.pdf

Speaking schedule (subject to change) is available from
ftp://ftp.tapr.org/dcc/2000.dcc.schedule.pdf

2297. u gotta see this

Newsgroup: rec.radio.amateur.space
Date: 2000-09-18 00:00:00 UTC
From: nobody <marka_1157@yahoo.com>
Message-ID: <39c6dff9@news.mdc.net>
Source record: 8432

Dear Friend:
With a couple of minutes of your time I'm
going to show you how you can
turn
$6 and
6 stamps into thousands of dollars. Don't
get skeptical yet, just read
the
letter and then decide if you want to invest
a measly $6!!

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND:
READING THIS COULD CHANGE YOUR LIFE! Wow!!
IT DOES WORK!

A little while back, I was browsing through
newsgroups, just like you
are
now, and came across an article similar to
this that said you could make

thousands of dollars within weeks with only
an initial investment of
$6.00!
So I thought, "Yeah right, this must be a
scam", but like most of us, I
was
curious, so I kept reading. Anyway, it said
that you send $1.00 to each
of
the 6 names and address stated in the
article. You then place your own
name
and address in the bottom of the list at #6,
and post the article in at
least 200 newsgroups.
(There are thousands) No catch, that was it.
So after thinking it over,
and
talking to a few people first, I thought
about trying it. I figured:
"What
have I got to lose except 6 stamps and
$6.00, right?" Then I invested
the

measly $6.00. Well GUESS WHAT!?...Within 7
days, I started getting money
in
the mail! I was shocked! I figured it would
end soon, but the money just

kept coming in. In my first week, I made
about $25.00. By the end of the

second week I had made a total of over
$1,000.00! In the third week I
had
over 10,000.00 and it's still growing. This
is now my fourth week and I
have made a total of just over $42,000.00
and it's still coming in
rapidly.
It's certainly worth $6.00, and 6
stamps, I have spent more than that on the
lottery!! Let me tell you how

this works and most importantly, WHY it
works... Also, make sure you
print a
copy of this article NOW, so you can get the
information off of it as
you
need it. I promise you that if you follow
the directions exactly, that
you
will start making more money than you
thought possible by doing
something so
easy!
Six Bucks and Six stamps... not a big deal
to get lots more $$$$. IT
WORKS!!!!
Suggestion: Read this entire message
carefully! (print it out or
download
it.) Follow the simple directions and watch
the money come in! It's
easy.
It's legal. And, your investment is only
$6.00 (Plus postage).

IMPORTANT: This is not a rip-off; it is not
indecent; it is not illegal;
and
it is 99% no risk - it really works! If all
of the following

instructions
are adhered to, you will receive
extraordinary dividends.

PLEASE NOTE:
Please follow these directions EXACTLY, and
$50,000 or more can be yours
in
20
to 60 days. This program remains successful
because of the honesty and
integrity of the participants. Please
continue its success by carefully
adhering to the instructions.
You will now become part of the Mail Order
business. In this business
your
product is not solid and tangible, it's a
service. You are in the
business
of developing Mailing Lists. Many large
corporations are happy to pay
big
bucks for quality lists. However, the money
made from the mailing lists
is
made from people like you and me asking to
be included in that list.

Here are the 4 EASY, EASY, EASY steps to
success:

STEP 1: Get 6 separate pieces of paper and
write the following on each
piece
of paper "PLEASE PUT ME ON YOUR MAILING
LIST."
Now get 6 US $1.00 bills and place ONE
inside EACH of the 6 pieces of
paper
so the
bill will not be seen through the envelope
(to prevent thievery).

Next, place one paper in each of the 6
envelopes and seal them. You
should
now have 6 sealed envelopes, each with a
piece of paper stating the
above
phrase, your name and address, and a $1.00

bill. What you are doing is
creating a service. THIS IS ABSOLUTELY
LEGAL! You are requesting a
legitimate service and you are paying for
it! Like most of us I was a
little
skeptical and a little worried about the
legal aspects of it all. So I
checked it out with the U.S. Post Office
(1-800-725-2161) and they
confirmed
that it is indeed legal. Mail the 6
envelopes to the following
addresses:

1) Wesley Hall
1253 Solomon Rd.
Santa Maria, CA 93455

2) Lisa Whitfield
915 South St.
Altoona, PA 16602

3) Sue Wagner
608 First Avenue
Altoona, PA 16602

4) C. Mangan
503 Oak Ave NW
Elkader, IA 52043

5) Richard Powers
748 Battlefield Blvd. South
Chesapeake, Va. 23322

6) Mark Anthony
121 st.stephen st. #12A
Boston, MA 02115

STEP 2: Now, you do not need to re-type this
entire letter . Simply put
your
cursor at the beginning of this letter and
drag your cursor to the
bottom of
this document, and select 'copy' from the
edit menu(or right mouse click
and
choose "copy"). This will copy the entire
letter into the computer's
memory
temporarily. Now click "Start" then

"accessories" then "wordpad" Open a

blank 'notepad' file and place your cursor
at the top of the blank page.

>From the 'edit' menu select 'paste'.(or
right mouse click and choose
"paste") This will paste a copy of the
letter into notepad so that you
can
add your name to the list. Take the #1 name
off the list that you see
above,(to do so, put your cursor at the end
of the address of the FIRST
(#1)
address and click "backspace" until name and
address are gone.) Change
the
other numbers to one lower number (6
becomes 5, 5 becomes 4, etc...) by

putting your cursor on the right side of
each number and pushing
backspace
one time, then type the new number and add
YOUR Name as number 6 on the
list. (when you add your name it may be
double spaced... thats ok.)

STEP 3:. Now, post your amended article to
at least 200 newsgroups (I
think
there are close to 24,000 groups). All you
need is 200,
but remember, the more you post, the more
money you make! You won't get
very
much unless you post like crazy. :) This is
perfectly legal! If you have
any
doubts, refer to Title 18 Sec. 1302 & 1341
of the Postal lottery laws.
Keep
a copy of these steps for yourself and,
whenever you need money, you can

use it again, and again.

PLEASE REMEMBER that this program remains
successful because of the
honesty
and integrity of the participants and by

their carefully adhering to the

directions. Look at it this way. If you are
of integrity, the program
will
continue and the money that so many others
have received will come your
way.

NOTE:
Iit might be a good idea to wrap the $1 bill
in dark paper to reduce the

risk of mail theft.) As each post is
downloaded and the directions
carefully
followed, six members will be
reimbursed for their participation as a List
Developer with one dollar
each.
Your name will move up the list so that when
your name reaches the #1
position you will be receiving thousands of
dollars in CASH!!! What an
opportunity for only $6.00 ($1.00 for each
of the first six people
listed
above) Send it now. Add your own name to the
list and you're in
business!

---EASY STEP BY STEP DIRECTIONS ----- FOR
HOW TO POST TO
NEWSGROUPS------------

BR3 is usually covering launches, but only live when they occur after about
01:30 (nighttime). When the launch is earlier, a tape is played after
closing of the regular programme.

Odd, I do not recall tunstile antenna's having any nulls. In fact, you can flatten the pattern by making the tunstile with inverted V's towards the ground plane.

Now attics can cause nulls. Wiring, siding, flashing, and my favorite, sheathing with metallic foil, can cause havoc with any hidden antenna system.

Have a look at http://www.flatoday.com/space/today/ this is a local
newspaper with dayly coverage of space news. They also have information on
visiting the space coast, obtaining launch viewing site passes, etc.

So can any circularly polarized antenna whose polarization
sense is the wrong way around. This is, in fact, the standard
test for correct polarization: monitor a pass and see if
there are deep nulls. My current crossed dipole was the
wrong way around - deep nulls and a weird pattern - until
I fixed it.

Every book ever written on the subject discusses this.

I'm sure I got the twist in the antenna going the right direction, so I'm not sure how that null got there. It appears to be directly over my location (Seattle area).

> Now attics can cause nulls. Wiring, siding, flashing, and my favorite,

I did put the antenna in a place that might cause a problem. I put it against the wall and it is near an air vent with a metal grille and metal vents on the outside. Also, it is facing some power lines (the big buzzing type) that another person told me most likely causes the diagonal lines. Could the metal vent be picking up more of the powerline crud and the antenna being so close be pulling it in from there?

I have been to Florida for a visit to the AMSAT P3D integration lab and
a short holiday, a couple of years ago. After booking, it turned out that
a shuttle launch was precisely in that window (just luck).

A friendly guy at the lab gave us his viewing pass, as he could not make it
to the site that day (more luck).

The shuttle went up right on time, and we got a wonderful view from the
closest viewing site open to general visitors (how lucky can you get).

However, I should warn you that you should not count too much on making
your own photographs or recordings. You will be too far away to get the
shots that appear on TV (starting engines etc). I used a 200mm lens on a
35mm camera, and the pictures I got were just "nice shots", nothing
spectacular.

So, it is probably better just to experience the launch and leave the
picture taking to the professionals and the unmanned cameras. You can buy
the merchandise at the visitor center. However, you should go at another
day for the KSC visit, most facilities are closed at launch days.

(another problem are the launch delays. I have seen a landing as well,
during another visit, when these were still at Edwards CA. Landings are
not postponed too much, so it is easier to plan around them)

Your problem with metal objects isn't the picking up of noise, but that
they reflect signals. When an object near the antenna reflects signals,
there will be two paths: one directly from the source to the antenna,
and one via the reflector. When the length of the paths differs by
half a wavelength, the two signals will cancel and you have a null.
The path length difference depends on the direction to the signal source,
because the reflector is at some distance from your antenna.

In fact, this is how directional antennas are made. You have unwillingly
made a directional antenna.

When we went there, we drove up to the viewing site in our own (rental)
car... the pass had to be placed behind the windshield and the security
personnel waved you to the correct location (based on the color of the
pass). After the event, you could keep the pass (which has a launch
number on it).

But there was a terrible traffic jam, especially to the larger (further
away) site. We had to park along a service road, the later you arrived
the longer the walk back. Probably they have now changed that so the
visitors park on the (american-sized) parking lot at the visitors center
and go to the site by bus.

(bus tours along various interesting and more boring buildings on the
launch complex are made on non-launch days, so the busses are available
anyway)

Message-ID: <8qdfbf$i4q@niven.ksc.nasa.gov>
Source record: 8351

I did it last weekend...
built a cross dipole and loaded WXSAT onto my PC.
hooked the mess up to my IC-R10 and decided to give it a go...

I got a passable pic of the gulf coast from NOAA12 on a 1745 [9-17]
northbound pass showing the storm hitting the Fl. panhandle...

on 9-18, I got a NOAA12 northbound pass showing the Great Lakes at 1645 and
at 1745 a NOAA 14 northbound pass showing the Great lakes also...
The NOAA 14 was the best pic yet...

I am waiting for the Bearcat 160 scanner I got off e-bay to come in so I can
mod it for WXSAT work only

I am excited to say the least!

thanks for all the info!

There won't be *any* frequency until they've checked the
satellite out and made sure it's working.

In the interim I intend to listen to passes to see if I
hear anything. There are only two possible frequencies,
and as an afternoon satellite, 137.62 is the likely choice...

2318. Two-way doppler program?

Newsgroup: rec.radio.amateur.space
Date: 2000-09-21 00:00:00 UTC
From: Allen Thomson <thomsona@flash.net>
Message-ID: <8qdonq$j1d$1@nnrp1.deja.com>
Source record: 8354

I'm about to embark on some experiments in detecting radio signals
reflected (passively, not retransmitted) from satellites, and need a
convenient way to predict the two-way doppler shift.

Inputs would be:

Transmitter frequency
Geographic coordinates of the transmitter
Geographic coordinates of the receiver
Orbital elements (TLEs) of the satellite(s)
Start time
Stop time
Update interval (in seconds, with fractions down to 1 millisecond)

Output would be pairs of numbers consisting of UTC time and received
frequency. An option to show the usual range, bearing, lat/lon, etc.
information along with the doppler would be nice, but not essential.

Is there a program out there that can to this, or something equivalent?

I'll write one if I must, but would rather just get something existing
if it's available.

In London Ontario Canada...

--- There are still a few tables left! ---

London Amateur Radio Club has another hamfest on the way. This is expected to be the biggest and best ever at our new location! Computers, radio equipment and electronics flea market! See the web site for more details!

www.larc.on.ca

Lot's of free parking! Food on site! Almost out of vendor tables!!
Reserve tickets early! Slots next door!

LARC HAMFEST 2000
SUNDAY, SEPT. 24TH
9:00 AM TO 1:00 PM
VENDORS SETUP 8:00 AM
ADMISSION: $6.00, TABLES: $8.00

More details at http://www.larc.on.ca

Yeah, I recorded 5 passes while I was at work,
using SatSignal on the wave file I usually get a visual spectrum picture and an near infrared one,
but this one was two visual spectrum pics for the first two passes,
the rest of the passes I got one black & white picture,
probably they are just testing the sats functions still... but it was nice to hear the new bird...

Sun synchronous orbit only means that the satellite will pass a
certain point at the same (solar) time each day, thus there is a
uniform illumination angle every day and it is easy to compare the
result. The orbital inclination is 95 .. 100 degrees and the orbital
period usually is an simple fraction of 24 hours, such as 2 h, 2:24
or 3 hours.

The only orbit that fits your description is the 06:00/18:00 orbit
(and 18:00/06:00), the North going pass is at the first time and the
South going pass at the second time. Such an orbit is not very good
for observations, since half of the regions directly below are in
darkness.

There are quite a lot of satellites going North around noon (12:00),
but when going South, it will pass over regions at around 24:00 local
time, thus in the middle of the night. Many satellites transmit
infrared pictures during the night.

2330. QFH Antenna grounding question

Newsgroup: rec.radio.amateur.space
Date: 2000-09-22 00:00:00 UTC
From: tegwilym@my-deja.com
Message-ID: <8qgjpbuij1@nnrp1.deja.com>
Source record: 8365

I don't think I can completely get rid of the noise from the powerlines near my place but I am trying to reduce it the best I can if possible. I am powering the pre-amp with a piece of twisted pair network cable that seems to be working well and RG-58 coax for the feeline to the antenna which is sitting in the attic. I am trying to work out a good way to ground it. There is a vent pipe in the attic nearby that I could ground to, which I tried to do last night. I thought it did some good since I didn't hear much extra noise. I checked it this morning only to realize the power wire broke to the pre-amp. I guess that could explain someting!

My question is: I could ground the antenna (I grounded at the case of the pre-amp to the vent pipe), or should I make sure the power supply is well grounded? I am powering both the radio and amp off an Astron 7am supply. I'm not sure how good the 3rd prong ground on the power cord is, but wouldn't is cause some problems to also ground it at the antenna on that pipe? I'm just wondering if having it grounded at both places would cause some strange problems?
Does anyone know any good ideas to ground a power supply that is in a bedroom? Should I run a cable along the floor to the bathroom and connect to a cold water pipe? The bathroom is next to the radio room.

not really, NOAA'S are sun syncronous, this means that they travel so they are always in the lit part of the terminator. Resurs when it transmits was tx'ing at night over me a while ago.

You should first make sure that you understand the effects that grounding
may have on your problem. You are problably over-estimating these effects.

Interference can be in-band, i.e. there is some signal or harmonic of a
signal that appears on the same frequency as the satellite.
That interference you can try to cure with all kinds of shielding and
grounding.
Use good cable for the antenna, make sure the power feed to the pre-amp
is well-decoupled near the preamp (capacitors of different values, i.e. an
electrolytic and a ceramic cap, an inductor and/or resistor in series).

Grounding will not do much, especially not at VHF.

Another cause of interference can be out-of-band, and is caused by poor
performance of the receiver. The receiver may be sensitive to other
signals, because of spurious frequencies generated in the receiver or
because of poor filtering. Or the FM detector in the receiver may be
sub-optimal, causing sensitivity to AM modulation.

When you are talking about powerline interference at VHF, I would expect
the latter to be the dominant cause of problems. Same when the
interference is from passing cars, etc.

A good receiver has a well-performing limiter that keeps all AM pulse noise out of the FM detector, and so there should be little interference from such signals unless your signal is weak (but then you will have a lot of general noise as well)

Rob

Message:

READING THIS COULD CHANGE YOUR LIFE! I found this=20
on a=20
bulletin board and decided to try it. A little while back, I was =
browsing=20
through newsgroups, just like you are now, and came across an article=20
similar to this that said you could make thousands of dollars within=20
weeks with only an initial investment of $6.00! So I thought, "Yeah=20
right, this must be a scam", but like most of us, I was curious, so I =
kept=20
reading. Anyway, it said that you send $1.00 to each of the 6 names=20
and address stated in the article. You then place your own name and=20
address in the bottom of the list at #6, and post the article in at =
least=20
200 newsgroups. (There are thousands) No catch, that was it. So after=20
thinking it over, and talking to a few people first, I thought about =
trying=20
it. I figured: "what have I got to lose except 6 stamps and $6.00, =
right?"=20
Then I invested the measly $6.00. Well GUESS WHAT!!...within 7=20
days, I started getting money in the mail! I was shocked! I figured it=20
would end soon, but the money just kept coming in. In my first week, I=20
made about $25.00. By the end of the second week I had made a total=20
of over $1,000.00! In the third week I had over $10,000.00 and it's =
still
growing. This is now my fourth week and I have made a total of just=20
over $42,000.00 and it still coming in rapidly. It's certainly worth=20
$6.00, & 6 stamps, I have spent more than that on the lottery!! Let me=20
tell you how=20
this works and most importantly, why it works....Also, make sure you=20
print a copy of this article NOW, so you can get the information off of=20
it as you need it. I promise you that if you follow the directions =
exactly,=20
```

that you will start making more money than you thought possible by=20
doing something so easy! Suggestion: Read this entire message=20
carefully! (print it out or download it.) Follow the simple directions =
and=20
watch the money come in! It's easy. It's legal. And, your investment is=20
only $6.00 (Plus postage) IMPORTANT:=20
This is not a rip-off; it is not indecent; it is not illegal; and it is =
virtually=20
no risk - it really works!!!! If all of the following instructions are=20
adhered to, you will
receive extraordinary dividends. PLEASE NOTE: Please follow these
directions EXACTLY, and $50,000 or more can be yours in 20 to 60=20
days. This program remains successful because of the honesty and=20
integrity of the participants. Please continue its success by carefully=20
adhering to the instructions. You will now become part of the Mail=20
Order business. In this business your product is not solid and tangible, =

it's a service. You=20
are in the business of developing Mailing Lists. Many large=20
corporations are happy to pay big bucks for quality lists. However,=20
the money made from the
mailing lists is secondary to the income which is made from people=20
like you and me asking to be included in that list. Here are the 4 easy=20
steps to success: STEP 1: Get 6 separate pieces of paper and write the=20
following on each piece of paper "PLEASE PUT ME ON YOUR=20
MAILING LIST." Now get 6 US $1.00 bills and place ONE inside=20
EACH of the 6 pieces of paper so the bill will not be seen through the=20
envelope (to prevent thievery). Next, place one paper in each of the 6=20
envelopes and seal them. You should now have 6 sealed envelopes,=20
each with a piece of paper stating the above phrase, your name and=20
address, and a $1.00 bill. What you are doing is creating a service.=20
THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate=20
service and you are paying for it! Like most of us I was a little=20
skeptical and a little worried about the legal aspects of it all. So I=20
checked it out with the U.S. Post Office (1-800-725-2161) and they=20
confirmed that it is indeed legal! Mail the 6 envelopes to the following =

addresses:

#1) Samantha Blizniak, 7937 S. Newcastle, Burbank, IL 60459

#2)Katie Wiess, 14 White Tail Lane, Wallingford, CT 06492

#3)Traci Wood, 4224 Carnwath Rd., Tallahassee, FL 32303

#4)Milissa Crook, 3730 South 255th Place, Kent, WA 98032

#5)James Buckner, 11903 Coit RD. #1803 Dallas, TX 75251

#6)Bobbi Mullins, 31 Sunnydale Lane, Napoleon, OH 43545

STEP 2: Now take the #1 name off the list that you see above, move=20
the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR=20

Name as number 6 on the list. STEP 3: Change anything you need to,=20
but try to keep this article as close to original as possible. Now, post =

your amended article to at least 200 newsgroups. (I think there are=20
close to 24,000 groups) All you need is 200, but remember, the more=20
you post, the more money you make! This is perfectly legal! If you=20
have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal=20
lottery laws. Keep a copy of these steps for yourself and, whenever=20
you need money, you can use it again, and again. PLEASE
REMEMBER that this program remains successful because of the=20
honesty & integrity of the participants & by their carefully adhering to =

the directions. Look at it this way. If you are of integrity, the =
program=20
will continue and the money that so many others have received will=20
come your way. NOTE: You may want to retain every name and=20
address sent to you, either on a computer or hard copy and keep the=20
notes people send you. This VERIFIES that you are truly providing a=20
service. (Also, it might be a good idea to wrap the $1 bill in dark =
paper=20
to reduce the risk of mail theft.) So, as each post is downloaded and =
the=20
directions carefully followed, six members will be reimbursed for their=20
participation as a List Developer with one dollar each. Your name will=20
move up the list geometrically so that when your name reaches the #1=20
position you will be receiving thousands of dollars in CASH!!! What an=20
opportunity for only $6.00 ($1.00 for each of the first six=20
people listed above) Send it now, add your own name to the list and=20
you're in business!=20
---DIRECTIONS -----=20
FOR HOW TO POST TO NEWSGROUPS----------=20
Step 1) You do not need to re-type this entire letter to do your own=20
posting. Simply put your cursor at the beginning of this letter and drag =

your cursor to the bottom of this document, and select 'copy' from the=20
edit menu. This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of=20
the blank page. From the 'edit' menu select 'paste'. This will paste a=20
copy of the letter into notepad so that you can add your name to the
list.=20
Step 3) Save your new notepad file as a .txt file. If you want to do =
your=20
postings in different settings, you'll always have this file to go back =
to.=20
Step 4) Use Netscape or Internet explorer and try searching for various=20
newsgroups (on-line forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new=20
message by highlighting the text of this letter and selecting paste from =

the edit menu. Fill in the Subject, this will be the header that =
everyone=20

sees as they scroll through the list of postings in a particular group,
click the post message button. You're done with your first one!
Congratulations...THAT'S IT! All you have to do is jump to different=20
newsgroups and post away, after you get the hang of it, it will take=20
about 30 seconds for each newsgroup! **REMEMBER, THE MORE=20
NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL=20
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200** That's=20
it! You will begin receiving money from around the world within days!=20
You may eventually want to rent a P.O.Box due to the large amount of=20
mail you will receive. If you wish to stay anonymous, you can invent a=20
name to use, as long as the postman will deliver it. **JUST MAKE
SURE ALL THE ADDRESSES ARE=20
CORRECT.** Now the WHY part: Out of 200 postings, say I receive=20
only 5 replies (a very low example). So then I made $5.00 with my
name at #6 on the letter. Now, each of the 5 persons who just sent me=20
$1.00 make the MINIMUM 200 postings, each with my name at #5=20
and only 5 persons respond to each of the original 5, that is another=20
$25.00 for me, now those 25 each make 200 MINIMUM posts with=20
my name at #4 and only 5 replies each, I will bring in an additional=20
$125.00! Now, those 125 persons turn around and post the MINIMUM=20
200 with my name at #3 and only receive 5 replies each, I will make an=20
additional $626.00! OK, now here is the fun part, each of those 625=20
persons post a MINIMUM 200 letters with my name at #2 and they=20
each only receive 5 replies, that just made me $3,125.00!!!=20
Those 3,125 persons will all deliver this message to 200 newsgroups
with my name at #1 and if still 5 persons per 200 newsgroups react I=20
will receive $15,625,00! With an original investment of only $6.00!=20
AMAZING! When your name is no longer on the list, you just take the=20
latest posting in the newsgroups, and send out another $6.00 to names=20
on the list, putting your name at number 6 again. And start posting=20
again. The thing to remember is: do you realize that thousands of=20
people all over the world are joining the internet and reading these
articles everyday?, JUST LIKE YOU are now!! So, can you afford
$6.00 and see if it really works?? I think so... People have said, "what
if the plan is played out and no one sends you the money? So what!
What are the chances of that happening when there are tons of new
honest users and new honest people who are joining the internet and
newsgroups everyday and are willing to give it a try? Estimates are at=20
20,000 to 50,000 new users, every day, with thousands of those
joining the actual internet.Remember, play FAIRLY and HONESTLY
and this will really work

print a copy of this article NOW, so you can get =
the=20
information off of
it as you need =
it. I=20
promise you that if you follow the directions exactly,
that you will start making more money than you =
thought=20
possible by
doing something so =
easy!=20
Suggestion: Read this entire message
carefully! (print it out or download it.) Follow the simple =
directions=20
and
watch the money come in! It's =
easy. It's=20
legal. And, your investment is
only $6.00=20
(Plus postage) IMPORTANT:
This is =
not a=20
rip-off; it is not indecent; it is not illegal; and it is virtually=20

no risk - it really works!!!! If =
all of the=20
following instructions are
adhered to, you=20
will
receive extraordinary =
dividends. PLEASE=20
NOTE: Please follow these
directions EXACTLY,=20
and $50,000 or more can be yours in 20 to 60

days. This program remains successful because of the honesty =
and=20

integrity of the participants. =
Please=20
continue its success by carefully
adhering to=20
the instructions. You will now become part of the Mail
Order business. In this business your product is =
not solid and=20
tangible,
it's a service. You=20

are in the business of developing =
Mailing=20
Lists. Many large
corporations =
are happy to=20
pay big bucks for quality lists. However,
the=20
money made from the
mailing lists =
is secondary=20
to the income which is made from people
like=20
you and me asking to be included in that list. Here are the 4 easy=20

steps to success: STEP 1: Get 6 =
separate=20
pieces of paper and write the
following on=20
each piece of paper "PLEASE PUT ME ON YOUR
MAILING LIST." Now get 6 US $1.00 bills and place ONE inside=20

EACH of the 6 pieces of paper so =
the bill=20
will not be seen through the
envelope (to=20
prevent thievery). Next, place one paper in each of the 6 =

envelopes and seal them. You should now have 6 =
sealed=20
envelopes,
each with a piece of =
paper stating=20
the above phrase, your name and
address, and=20
a $1.00 bill. What you are doing is creating a service.
THIS IS ABSOLUTELY LEGAL! You are requesting a =
legitimate=20

service and you are paying for =
it! Like most=20
of us I was a little
skeptical =
and a little=20
worried about the legal aspects of it all. So I
checked it out with the U.S. Post Office (1-800-725-2161) and =
they=20

confirmed that it is indeed =
legal! Mail the 6=20
envelopes to the following
addresses:

#1) =
Samantha Blizniak,=20
7937 S. Newcastle, Burbank, IL 60459

#2)Katie Wiess, 14 White Tail Lane, Wallingford, CT=20
06492

#3)Traci Wood, 4224 =
Carnwath Rd.,=20
Tallahassee, FL 32303

#4)Milissa Crook, 3730 South 255th =
Place, Kent,=20
WA 98032

#5)James Buckner, =
11903 Coit RD.=20
#1803 Dallas, TX 75251

#6)Bobbi Mullins, 31 Sunnydale Lane, Napoleon, OH =
43545

STEP 2: Now take the #1 name off the list that you =
see above,=20
move
the other names up (6 =
becomes 5, 5=20
becomes 4, etc...) and add YOUR
Name as=20
number 6 on the list. STEP 3: Change anything you need to, =

but try to keep this article as close to original =
as possible.=20
Now, post
your amended article to =
at least=20
200 newsgroups. (I think there are
close to=20
24,000 groups) All you need is 200, but remember, the more =

you post, the more money you make! This is =
perfectly legal! If=20
you
have any doubts, refer to =
Title 18 Sec.=20
1302 & 1341 of the Postal
lottery laws.=20
Keep a copy of these steps for yourself and, whenever
you need money, you can use it again, and again.=20
PLEASE
REMEMBER that this program =
remains=20
successful because of the
honesty =
&=20
integrity of the participants & by their carefully adhering to=20

the directions. Look at it this =
way. If you=20
are of integrity, the program
will continue=20
and the money that so many others have received will
come your way. NOTE: You may want to retain every name and=20

address sent to you, either on a =
computer or=20
hard copy and keep the
notes =
people send you.=20
This VERIFIES that you are truly providing a
service. (Also, it might be a good idea to wrap the $1 bill in =
dark paper=20

to reduce the risk of mail =
theft.) So, as=20
each post is downloaded and the
directions=20
carefully followed, six members will be reimbursed for their =

participation as a List Developer with one dollar =
each. Your=20
name will
move up the list =
geometrically so=20
that when your name reaches the #1
position=20
you will be receiving thousands of dollars in CASH!!! What an =

opportunity for only $6.00 ($1.00 for each of the =
first six=20

people listed above) Send it now, =
add your=20

own name to the list and
you're =
in business!=20

---DIRECTIONS ----- =

FOR HOW TO POST TO NEWSGROUPS---------- =

Step 1) You do not need to re-type this entire =
letter to do=20
your own
posting. Simply put your =
cursor at=20
the beginning of this letter and drag
your=20
cursor to the bottom of this document, and select 'copy' from the=20

edit menu. This will copy the =
entire letter=20
into the computer's memory.
Step =
2) Open a=20
blank 'notepad' file and place your cursor at the top of =

the blank page. From the 'edit' menu select =
'paste'. This will=20
paste a
copy of the letter into =
notepad so=20
that you can add your name to the
list.=20

Step 3) Save your new notepad =
file as a .txt=20
file. If you want to do your
postings in=20
different settings, you'll always have this file to go back to. =

Step 4) Use Netscape or Internet explorer and try =
searching=20
for various
newsgroups (on-line =
forums,=20
message boards, chat sites, discussions.)
Step=20
5) Visit these message boards and post this article as a new =

message by highlighting the text of this letter =
and selecting=20
paste from
the edit menu. Fill in =
the=20
Subject, this will be the header that everyone

sees as they scroll through the list of postings in a =
particular=20
group,
click the post message =
button. You're=20
done with your first one!
Congratulations...THAT'S IT! All you have to do is jump to =
different=20

newsgroups and post away, after =
you get the=20
hang of it, it will take
about 30 =
seconds for=20
each newsgroup! **REMEMBER, THE MORE
NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL =

MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200** =
That's=20

it! You will begin receiving =
money from=20
around the world within days!
You =
may=20
eventually want to rent a P.O.Box due to the large amount of =

mail you will receive. If you wish to stay =
anonymous, you can=20
invent a
name to use, as long as =
the postman=20
will deliver it. **JUST MAKE
SURE =
ALL THE=20
ADDRESSES ARE
CORRECT.** Now the =
WHY part:=20
Out of 200 postings, say I receive
only 5=20
replies (a very low example). So then I made $5.00 with =
my
name at #6 on the letter. Now, each of the 5 =
persons who just=20
sent me
$1.00 make the MINIMUM =
200 postings,=20
each with my name at #5
and only =
5 persons=20
respond to each of the original 5, that is another

$25.00 for me, now those 25 each make 200 MINIMUM posts with=20

my name at #4 and only 5 replies =
each, I will=20
bring in an additional
$125.00! =
Now, those=20
125 persons turn around and post the MINIMUM
200 with my name at #3 and only receive 5 replies each, I will =
make an=20

additional $626.00! OK, now here =
is the fun=20
part, each of those 625
persons =
post a=20
MINIMUM 200 letters with my name at #2 and they
each only receive 5 replies, that just made me $3,125.00!!!=20

Those 3,125 persons will all =
deliver this=20
message to 200 newsgroups
with my =
name at #1=20
and if still 5 persons per 200 newsgroups react I
will receive $15,625,00! With an original investment of only =
$6.00!=20

AMAZING! When your name is no =
longer on the=20
list, you just take the
latest =
posting in the=20
newsgroups, and send out another $6.00 to names
on the list, putting your name at number 6 again. And start =
posting=20

again. The thing to remember is: =
do you=20
realize that thousands of
people =
all over the=20
world are joining the internet and reading these
articles everyday?, JUST LIKE YOU are now!! So, can you=20
afford
$6.00 and see if it really =
works?? I=20
think so... People have said, "what
if the=20
plan is played out and no one sends you the money? So =
what!
What are the chances of that happening when there =

```
are tons of=20
new
honest users and new honest =
people who are=20
joining the internet and
newsgroups everyday=20
and are willing to give it a try? Estimates are at
20,000 to 50,000 new users, every day, with thousands of=20
those
joining the actual =
internet.Remember,=20
play FAIRLY and HONESTLY
and this =
will really=20
work

------=_NextPart_000_0005_01C02598.EEDB9AC0--
```

Good stuff. I got what would have been a superb image from NOAA-16
Sunday afternoon, except for some severe terrestrial interference.
It was sending two visual images side by side.

I know exactly which power pole it is, but when I phoned the power
company they seemed to think I was some sort of nut. :-(

Last night I posted a few more pictures. I have some really clear ones from NOAA-16 there now. They are actually a a bit sharper in the .bmp format than they are on the web page (.jpg), but it would just take too long do download.
That Satellite seems a lot stronger than the other NOAAs. Either that, or maybe I just did something to my station that finally made it all work correctly!

> I know exactly which power pole it is, but when I phoned the power
> company they seemed to think I was some sort of nut. :-(

I was having power line inferferrence also (until it mostly went away this weekend), but I'm afraid they will think I am some kind of wacko if I call and ask about it. Too bad they don't share the fun we have with our radios!

On another topic, I have a question about processing images. I have had good results using David Taylor's SatSignal software when processing the Resurs satellite images, but most of the time when I try a NOAA image, it will do its thing, then nothing will show up on the screen. I do set it on NOAA, and the autodetect will also find it is a NOAA satellite, so I think I'm missing something somwhere.

Ok, actually I have 3 questions, here are 2 more:

What settings in WxSat should I be playing with to get decent color images from the NOAA satellites? I have been messing around with them, and most of the time they come out looking overexposed, or all white with some green, but not much else.

Final question.

I downloded David Taylor's software that I assume should overlay country borders on the images, but again, I run the program and not much happens. I'm not sure if I understand the procedure or what order I should be running the software to get the overlays on my image.

Thanks in advance for any advice you all give me!

Some people on rec.radio.shortwave recommend taking a sledgehammer and thumping
on the pole to see if you shake something loose.

Me too, but I always attributed it to not a clear enough signal. I've never
seen a decent IR image.

If I'm not mistaken, only the registered version does overlays.

As for nothing happening, I've only tried it a few times and I've found that you
need a really clear signal. In fact, I've never got it to produce a color
image, only greyscale, from my indoor antenna.

And is it just me, or doesn't it compensate for doppler shift? WXsat does this
just fine, but I tried Taylor's program because I got tired of recording the
audio and tweaking the amplification parameters on each pass.

I would do that, but I'm sure I'd get caught. The power lines are the huge type on the large 150+ foot silver metal tower. I would have to bang away at that thing pretty hard, and I'm sure that would attract a lot of attention! :-)

> If I'm not mistaken, only the registered version does overlays.

Yeah, I think that's right. I was just reading the help file and noticed there are extra features in the registered version. I just don't understand why I can't even get it to process any of the NOAA images. It does a great job on the Resurs though, works out the contrast quite nicely.

>

I can get it to do color with WxSat, but I just need to tweak the numbers to get it to look good. I just don't know what they all mean and it's just trial and error.

> And is it just me, or doesn't it compensate for doppler shift? WXsat does
this

I'm not sure, I haven't had any doppler problems with WxSat. When processing the Resurs images with SatSignal, I find that after I process the image, it looks ok, but is all skewed. I hit the re-sync feature and it fixes it.

What you shake loose may fall. It may be the transformer, or the power line, that's loose. Banging on power poles is thus somewhat dangerous. It does usually change the noise temporarily, though, and can help you identify the offending pole. You just have to ask yourself if you feel lucky. (The odds are actually pretty good that nothing drastic will happen, but you only have to be unlucky once.)

Most power companies have a department that deals with line noise issues. Line noise is a tipoff that something is wrong on the pole, and that can affect power reliability. The power company isn't making any money while a power line is out of service, so they usually like to get these reports so that they can fix things before there is a service interruption. You have to find the right person at the power company to contact to get the process started. That sometimes takes a few calls, but they usually will come out and try to find the problem and fix it.

2349. AR-3000a Scanner bandwidth mod - Advice needed!

Newsgroup: rec.radio.amateur.space
Date: 2000-09-26 00:00:00 UTC
From: Dave Alden <dalden@home.com>
Message-ID: <ADBE3884A6276D71.0155D902A7563EA0.491D09475F2529C5@lp.airnews.net>
Source record: 8383

I have an AR3000a scanner that I want to modify to be able to receive satellites on both 137 mHz and 1691 mHz. AOR-UK has a modification they do which involves installing a switchable 50 kHz filter that can be switched in and out with the stock WFM filter (230 Khz).

It is a rather complicated mod that involves a tiny custom made pc board and some delicate work with subminiature components. They do it in house but the have advised me that the cost of shipping my unit to and from England along with the customs fees is very expensive, more so than the mod work itself. In addition, since my unit is one of the older ones that has full coverage (cell band), I risk confiscation on it's return to the US. They won't supply me with a kit to do the mod myself.

My question is:

Can I safely place a .01 mfd capacitor IN PARALLEL with the current NFM filter and run some wires to a switch so that I could switch it in and out of the circuit? I really don't want to rip out the current NFM filter and destroy the utility od this unit as a scanner.

Will wires going to a switch cause any problems with stray signals or affect the performance of the NFM filter ?

What is the typical bandwidth created when a .01 cap is inserted?

Maybe this is a dumb idea altogether.

Any advice would be appreciated!

Dave - KB8VJD

Hello,

This e-mail contains the ENTIRE PLAN of how YOU can make
$50,000 or more in the next 90 days by simply sending e-mail! Seem
impossible? Just read on to see how it works AND HOW EASY IT IS....

*** PRINT THIS INFORMATION NOW FOR FUTURE REFERENCE ***

Due to the popularity of this letter on the Internet, a major nightly
news program recently devoted an entire show to the investigation of the
program described below to see if it really can make people money.
The show also investigated whether or not the program was legal. Their
findings proved that there are absolutely no laws prohibiting the
participation in the program. This has helped to show people that this
is a simple, harmless and fun way to make some extra money at home. The
results have been truly remarkable. So many people are participating that those
involved are doing much better than ever before. Since everyone makes
more as more people try it out, it's been very exciting. You will understand
once you try it yourself!

********* THE ENTIRE PLAN IS OUTLINED BELOW *********

$$

If you would like to make at least $50,000 in less than 90 days! Please
read this program...THEN READ IT AGAIN!!

$$

This is a Legitimate, Legal, Money Making Opportunity!!

It does Not require you to come into contact with people or make or take
any telephone calls.

Just follow the instructions and you will make money. This simplified
E-mail marketing program works perfectly 100% EVERY TIME!!!

References..

Hello my name is Johnathon Rourke, I'm from Rhode Island.

The enclosed information is something I almost let slip through my
fingers. Fortunately, sometime later I re-read everything and gave some
considerable thought and study to it.

Two years ago, the Corporation I worked for the past twelve years
down-sized and my position was eliminated.

After unproductive job interviews, I decided to open my own business.
Over the past year, I incurred many unforeseen financial problems.

I owed my family, friends and creditors over .. $35,000. The economy was
taking a toll on my business and I just couldn't seem to make ends meet.
I had to refinance and borrow more against my home to support my family
and struggling business.

At that moment.. something significant happened in my life.

I am writing this reference to share the experience in hope that this
could change your life .. Forever!!! Financially $$$$!!!

In mid December, I received this program in my E-mail. Six months prior
to receiving this program I had been sending away for information on
various business opportunities.

All of the programs I received, in my opinion, were NOT cost effective,
they were either too difficult for me to comprehend or the initial investment
was too much for me to risk to see if they worked.
As I was saying in December of 1998 I received this program.
I didn't send for it, or ask for it, they just got my name off a mailing
list.

Thank goodness for that!!!

After reading it several times, to make sure I was reading it correctly.
I couldn't believe my eyes!

Here was a MONEY MAKING MACHINE I could start immediately without any
debt. Like most of you I was still a little skeptical and a little worried
about the legal aspects of it all. So I checked it out with the U.S. Post
Office (1-800-725-2161 24-hrs) and they confirmed that it is indeed legal!

After determining the program was LEGAL I decided "WHY NOT!?!?!?!?".
Initially I sent out 10,000 e-mails. It cost me about $15.00 for my time

on-line. The great thing about e-mail is that I don't need any for
printing to send out the program, and because I also send the product (reports)
by e-mail, my only expense is my time.

In less than one week, I was starting to receive orders for REPORT # 1.

By January 13, I had received 26 orders for REPORT # 1.
. YOUR GOAL IS TO RECEIVE (at least) 20 ORDERS FOR REPORT #1 WITHIN
2 WEEKS, IF YOU DON'T, SEND MORE PROGRAMS UNTIL YOU DO

My first step in making $50,000 in 90 days was done. By January 30, I
had received 196 orders for REPORT #2.
. YOUR GOAL IS TO RECEIVE AT LEAST 100 + ORDERS FOR REPORT #2
WITHIN 2 WEEKS, IF NOT, SEND OUT MORE PROGRAMS UNTIL YOU DO. ONCE YOU

HAVE 100 ORDERS, THE REST IS EASY, RELAX, YOU WILL MAKE YOUR $50,000 GOAL

Well, I had 196 orders for REPORT # 2, 96 more than I needed. So I sat
back and relaxed. By March 1, of my E-mailing of 10,000, received $58,000 US

with more coming in every day. I paid off ALL my debts and bought a much needed new car!

Please take your time to read this plan, IT WILL CHANGE YOUR LIFE FOREVER $!!!!!!! Remember, it won't work if you don't try it.

This program does work, BUT you must follow it EXACTLY!

Especially the rules of not trying to place your name in a different place. It won't work and you'll lose out on a lot of money!. In order for this

program to work, you must meet your goal 0f 20+ orders for REPORT # 1, and 100+ orders for REPORT # 2 and you will make $50,000 or more in 90 days.

I AM LIVING PROOF THAT IT WORKS !!!!!!

If you choose not to participate in this program, I am sorry. It really is a great opportunity with little cost or no risk to you.

If you choose to participate, follow the program and you will be on your way to financial security. If you are a fellow business owner and are in financial trouble like I was, or you want to start your own business, consider this a sign. I DID $$$

Sincerely,
Johnathon Rourke

****

A PERSONAL NOTE FROM THE ORIGINATOR OF THIS PROGRAM:

By the time you have read the enclosed program and reports, you should have concluded that such a program, and one that is legal, could not have been created by an amateur. Let me tell you a little about my self.

I had a profitable business for 10 years. Then in 1979 my business began falling off. I was doing the same things that were previously successful for me, but it wasn't working. Finally, I figured it out. It was not me, it was the economy. Inflation and recession had replaced the stable economy that had been with us since 1945.

I don't have to tell you what happened to the employment rate.... because many of you know from first hand experience. There were more failures and bankruptcies than ever before. The middle class was vanishing. Those who knew what they were doing invested wisely and moved up. Those who did not, including those who never had anything to save or to invest, were moving

down into the ranks of the poor. As the saying goes, "THE RICH GET RICHER AND THE POOR GET POORER."

The traditional methods of making money will never allow you to "move up" or "get rich", inflation will see to that.

You have just received information that can give you Financial-Freedom
for the rest of your life, with "NO RISK" and "JUST A LITTLE BIT OF EFFORT."
You can make more money in the next few months than you have ever imagined.
I should also point out that I will not see a penny of this money, nor
anyone else who has provided a testimonial for this program.

I have retired from the program after sending thousands and thousands of

programs. Follow the program EXACTLY AS INSTRUCTED. Do not change it in
any way. It works exceedingly well as it is now. Remember to e-mail a copy
of
this exciting report to everyone you can think of. One of the people you

send this to may send out 50,000... and your name will be on everyone of

them!

REMEMBER though, ~~~~ the MORE YOU SEND OUT, the more potential
customers
you will reach. So my friend, I have given you the ideas, information,
materials and opportunity to become financially independent.

IT IS UP TO YOU !!! NOW JUST DO IT !!!!

BEFORE YOU delete this program from your in box, as I almost did, take a

little time to read it and REALLY THINK ABOUT IT.

Get a pencil and figure out what could happen when YOU participate.
Figure
out the worst possible response and no matter how you calculate it, you
will
still make a lot of money! You will definitely get back what you
invested.
Any doubt you have will vanish when your first orders come in.

$$$$$ IT WORKS!!! $$$$$

Jody Jacobs - Richmond, VA

****

HERE'S HOW THIS AMAZING PROGRAM WILL MAKE YOU THOUSANDS OF DOLLARS
$$$$$

This method of raising capital REALLY WORKS 100% EVERY TIME.

I am sure that you could use up to $50,000 US or more in the next 90
days.

Before you say "BULL...", please read this program carefully. This is
not a
chain letter, but a perfect legal money making business.

As with all multi-level businesses, we build our business by recruiting
new partners and selling our products. Every state in the USA allows you to
recruit new multi-level business partners, and we sell and deliver a

product for EVERY dollar received.

YOUR ORDERS COME BY MAIL AND ARE FILLED BY E-MAIL, so you are not involved in personal selling. You do it privately in your own home, store or office. This is the EASIEST marketing plan anywhere! It is simply order filling by E-mail.

The product is informational and instructional material, keys to the secrets for everyone on how to open the doors to the magic world of E-COMMERCE, the information highway, the wave of the future!

PLAN SUMMARY:

(1) You order the 4 reports listed below ($5.00 US each). They come to you by e-mail.

(2) Save a copy of this entire letter and put your name after Report # 1 and move the other names down.

(3) Via the internet, access Yahoo.com or any of the other major search engines to locate hundreds of bulk email service companies (search for "bulk email") and you will find lists with a few hundred thousand to several million e-mail
addresses starting at about $49.00 +. Remember though REPORT #2 will show you how to do all of this in full detail.

(4) Orders will come to you by postal mail - simply email them the Report they ordered. Let me ask you - isn't this about as easy as it gets?

****

By the way there are over 50 MILLION email addresses with millions more joining the Internet each year so don't worry about "running out" or "saturation". People are used to seeing and hearing the same advertisements every day on radio/TV.

How many times have you received the same pizza flyers on your door? Then one day you are hungry for a pizza and you order one. Same thing with this letter. I received this letter many times - then one day I decided it was time to try it.

****

YOU CAN START TODAY - JUST DO THESE EASY STEPS:

STEP # 1. ORDER THE FOUR REPORTS

Order the four Reports shown on the list below (you can't sell them if you don't order them).-- For each Report send $5.00 US CASH and
. NAME & NUMBER OF THE REPORT YOU ARE ORDERING
. YOUR E-MAIL ADDRESS
. YOUR NAME WITH RETURN ADDRESS (in case of a problem)

to the person whose name appears on the list next to the report.

MAKE SURE YOUR RETURN ADDRESS IS ON YOUR ENVELOPE IN CASE OF ANY MAIL PROBLEMS!

Within a few days you will receive, by e-mail, each of the four reports.

Save them on your computer so you can send them to the 1.000's of people who will order them from you.

STEP # 2, ADD YOUR MAILING ADDRESS TO THIS LETTER.

IMPORTANT-- DO NOT alter the names of the people who are listed next to each report, or their sequence on the list, in any way other than is instructed below
in steps "A" through "F" or you will lose out on the majority of your profits. Once
you understand the way this works, you'll also see how it doesn't work if you change it.
Remember, this method has been tested, and if you alter it, it will not work.

A. Look below for the listing of the four reports.

B. After you've ordered the four reports, take this Advertisement and remove the name and address under REPORT #4. This person has made it through the cycle and is no doubt counting their $50,000!

C. Move the name and address under REPORT # 3 down to REPORT # 4.

D. Move the name and address under REPORT # 2 down to REPORT # 3.

E. Move the name and address under REPORT # 1 down to REPORT # 2.

F. Insert your name and address in the REPORT # 1 position. Please make

sure you COPY ALL INFORMATION, every name and address, ACCURATELY.

STEP # 3, SAVE THIS E-MAIL TO YOUR COMPUTER

Take this entire letter, including the modified list of names, and save it to your computer. Make NO changes to these instructions. Now you are ready to use this entire E-mail to send by E-mail to prospects.

Report #2 will tell you how to download bulk e-mail software and e-mail addresses so you can send it out to thousands of people while you sleep!

Remember that 50,000 + new people are joining the internet every month.

Your cost to participate in this is practically nothing (surely you can afford $20.00 US and initial bulk mailing cost). You obviously already have a computer and an Internet connection and E-mail is FREE.

STEP # 4, DISTRIBUTE THIS E-MAIL OVER THE INTERNET

There are two primary methods of building your downline network:

Method # 1: Sending Bulk E-Mail

Let's say that you decide to start small, just to see how it goes, and
we'll assume you and all those involved email out only 2,000 programs each.
Let's also assume that the mailing receives a 0.5% response. The response
could be much better. Also, many people will email out hundreds of thousands
of programs instead of 2,000 (why stop at 2,000?) But continuing with this
example, you send out only 2,000 programs. With a 0.5% response, that
is only 10 orders for REPORT # 1. Those 10 people respond by sending out
2,000 programs each for a total of 20,000.

Out of those 0.5%, 100 people respond and order REPORT # 2. Those 100
mail out 2,000 programs each for a total of 200,000.

The 0.5% respond to that is 1,000 orders for ..

REPORT # 3. Those 1,000 send out 2,000 programs each for a total of
2,000,000. The 0.5% respond to that is 10,000 orders for..

REPORT # 4. That's10,000 $5.00 US bills for you. CASH!!!

Your total income in this example is.. $50 + $500 + $5,000 + $50,000
for a total of .. $55,550!!!!

Remember friend, this is assuming 1,990 out of 2,000 people you email
to will do absolutely nothing and trash this program!

Dare to think for a moment what would happen if everyone, or half sent
out 100,000 programs instead of 2,000, believe me, many people will do just
that and more!

Method # 2.. Placing Free Ads on the Internet

Advertising on the Internet is very, very inexpensive, there are
HUNDREDS of FREE places to advertise. Lets say you decide to start small just to
see how well it works. Assume your goal is to get ONLY 10 people to participate
on your first level. (Placing a lot of FREE ads on the Internet will easily
get a LARGER response). Also assume that everyone in your organization gets

only 10 downline members, just look how this small number accumulates to

achieve the STAGGERING results below...

1st Level-- Your first 10 send you $5 = $50.00
2nd Level-- 10 Members from those 10 ($5 X100) = $500.00
3rd Level-- 10 Members from those 100 ($5 X1,000) = $5,000.00
4th Level-- 10 Members from those 1,000 ($5 X10,000) = $50,000.00

$$$$$$$ THIS TOTAL'S = $55,550 $$$$

AMAZING ISN'T IT?? Remember friends, this assumes that the people who
participate only recruit 10 people each. Think for a moment what would
happen if they got 20 people to participate! Most people get 100's of
participants and many will continue to work this program, WITH YOUR NAME
ON THEM FOR YEARS!! THINK ABOUT IT!

People are going to get details about this plan from you 'or' someone
else... the question is... Don't you want your name to be on the Emails

they will send out??

** DON'T MISS OUT!!! ** JUST TRY IT ONCE!!! ** SEE WHAT HAPPENS!!! **
YOU'LL BE AMAZED!!!

****

ALWAYS PROVIDE SAME-DAY SERVICE ON ORDERS!

This will guarantee that the E-mail THEY send out with your name and
address on it will be prompt because they can't advertise until they receive the

REPORT!

****

GET STARTED TO-DAY: PLACE YOUR ORDER FOR THE FOUR REPORTS...NOW!!

NOTES.. -- ALWAYS SEND $5.00 CASH (US CURRENCY) FOR EACH REPORT.
CHECKS, MONEY ORDERS, OR CASHIER CHECKS ARE NOT ACCEPTED!

Make sure the CASH is concealed by wrapping it in two sheets of paper.
On one of those sheets write...

A. The Number and Name of the Report you are Ordering.

B. Your E-mail address, and .

C. Your name and postal address.

PLACE YOUR ORDER FOR THESE REPORTS NOW:

REPORT # 1 " The Insider's Guide to Advertising for Free on the
Internet".

ORDER REPORT # 1 FROM...

Cris Mathis
22506 Tullis Trail Court
Katy, TX 77494
USA

REPORT # 2 "The Insider's Guide to Sending Bulk E-mail on the Internet"

ORDER REPORT # 2 FROM....

DANNY CONNELL
2100 FAIRWAY COURT
KENNESAW, GA 30144
USA

REPORT # 3 "The Secrets to Multilevel Marketing on the Internet".

ORDER REPORT # 3 FROM....

Cainco Associates
8001 San Miguel Cyn
#254
Salinas, CA 93907
USA

REPORT # 4 "How to Become a Millionaire Utilizing the Power of
Multilevel
Marketing and the Internet".

ORDER REPORT # 4 FROM...

RANDY BOMAR
P.O. BOX 66696
HOUSTON, TX 77266-6696
USA

*******TIPS FOR SUCCESS*******

TREAT THIS AS YOUR BUSINESS!! Be prompt, professional, follow the
directions
accurately -- send for the four reports 'IMMEDIATELY' so you have them
when
the orders start coming in because:

When you receive a $5 order, you MUST send out the requested
product/report.
It is required for this to be a legal business and they need the reports
to
send out their letters (with your name on them!)

ALWAYS PROVIDE SAME-DAY SERVICE ON THE ORDERS YOU RECEIVE.

BE PATIENT AND PERSISTENT WITH THIS PROGRAM!!
If you follow the instructions exactly-- results WILL FOLLOW. $$$$.

******* YOUR SUCCESS GUIDELINES*******

Follow these guidelines to guarantee your success:

If you don't receive 20 orders for REPORT # 1 within two weeks,
continue
advertising or sending e-mails until you do. Then, a couple weeks later
you
should receive at least 100 or more orders for REPORT # 2. If you
don't,
continue advertising or sending e-mails until you do. Once you have
received
100 or more orders for REPORT # 2, YOU CAN RELAX, because the system is

already working for you, cash will continue to roll in!!

THIS IS IMPORTANT TO REMEMBER... Every time your name is moved down on the
list, you are placed in front of a DIFFERENT REPORT.

You can keep track of your PROGRESS by watching which report people are
ordering from you.

To generate more income, simply send another batch of e-mails or continue
placing ads and start the whole process again!!

THERE IS NO LIMIT TO THE INCOME YOU WILL GENERATE FROM THIS BUSINESS!

Before you make your decision as to weather or not to participate in this
program. Please answer one question.

ARE YOU HAPPY WITH YOUR PRESENT INCOME OR JOB?? If the answer is no, then
please look at the following facts about this super simple MLM program:

. No face to face selling, No meetings, No Inventory, No telephone calls, No
big cost to start, Nothing to learn, No skills needed! (Surely you know how
to send an e-mail?).

. No equipment to buy- you already have a computer and Internet connection-
so you have everything you need to fill orders!

. You are selling a PRODUCT which does NOT COST YOU ANYTHING TO PRODUCE OR
SHIP! E-mailing copies of the Reports is FREE!

. All of your customers pay you in CASH! This program will change your LIFE
FOREVER! Look at the potential for you to be able to quit your job and live
a life of luxury that you could only dream about!

. Imagine getting out of debt and buying the car and home of your dreams and
being able to work a super-high paying leisurely easy business, from home
with no overheads!

$$$ FINALLY MAKE SOME DREAMS COME TRUE !! $$$

ACT NOW!! Take your first step towards achieving financial independence.
Order the REPORTS and follow the PROGRAM outlined above--SUCCESS WILL BE

Nice looking web page, but I don't see where his satellite images are
that were done with his "Real" radio.

Ok so my pictures may look like crap, but I'm excited about them, and
they sure look a lot better than they did when I stared out a month
ago! Soon I'll get a new radio, but for now I'm perfectly happy with
my "Toy".

Do you really believe that the pictures you're showing are NICE !?!?!? The Resurs picture seems taken by a system of 30 years ago ! Just throw away your toy receiver and buy a real 137 MHz rx and do not discourage the fellows wanting to start and watching your poor pictures.

Best 73s,

H

Yes,

It works pretty much the same. There have been some improvments,
easier to load keps, etc.

2373. Fiberglass crossboom and grounding

Newsgroup: rec.radio.amateur.space
Date: 2000-09-30 00:00:00 UTC
From: ka9clp@my-deja.com
Message-ID: <8r45icdve1@nnrp1.deja.com>
Source record: 8308

I am putting up a set of crossed yagi antenna for Phase 3D. One is 2 meter the other is 70 cm. My question is this. The crossboom I am using is fiberglass. In order to ground the 2 antenna, should I just ground the braid on the coax of each to my lightening rod or connect a copper braid between the 2 antenna and then ground that. My old set up had a aluminum crossboom, so it was not a problem.I just grounded the mast and the crossboom.

Any ideas or suggestions would be appreciated.

Email me at pinkawa@mediaone.net

Dear Friend,

Thank you for your time and interest. This email contains the ENTIRE PLAN of how YOU can make $50,000 or more in the next 90 days simply sending email! Seem impossible? Just read on and see how easy this is...

Due to the popularity of this letter on the Internet a major nightly news program recently devoted an entire show to the investigation of the program described below to see if it really can make people money. The show also investigated whether or not the program was legal. Their findings proved that there are absolutely no laws prohibiting the participation in the program. This has helped to show people that this is a simple, harmless and fun way to make some extra money at home. The results have been truly remarkable. So many people are participating that those involved are doing much better than ever before. Since everyone makes more as more people try it out, it's been very exciting. You will understand once you try it yourself!

**********THE ENTIRE PLAN IS HERE BELOW**********

Print This Now For Future Reference

$$$

If you would like to make at least $50,000 in less than 90 days Please read this program...THEN READ IT AGAIN!!!

$$$

THIS IS A LEGITIMATE, LEGAL, MONEY MAKING OPPORTUNITY!!! It does NOT require you to come into contact with people or make or take any phone calls. Just follow the instructions, and you will make money. This simplified e-mail marketing program works perfectly, 100% EVERY TIME! Email is the sales tool of the future. Take advantage of this virtually free method of advertising NOW!!! The longer you wait, the more people will be doing business using email. Get your piece of this action!!!

~~~~~~

Before you delete this program from your in-box, as I almost did, take a little time to read it and REALLY
~~~~~~

THINK ABOUT IT. Get a pencil and figure out what could happen when YOU participate. Figure out the worst possible response and no matter how you calculate it, you will still make a lot of money! You will definitely get back what you invested. Any doubts you have will vanish when your first orders come in.

$$$ IT WORKS $$$

Jody Jacobs Richmond, VA

~~~~~~

HERE'S HOW THIS AMAZING PROGRAM WILL
MAKE YOU THOUSANDS OF DOLLARS $$$$!!!!

This method of raising capital REALLY WORKS 100% EVERYTIME. I am sure that you could use up to $50,000 or more in the next 90 days. Before you say, "BULL..." please read this program carefully. This is not a chain letter, but a perfectly legal money making business.

As with all multi-level businesses, we build our business by recruiting new partners and selling our products. Every state in the USA allows you to recruit new multi-level business partners, and we sell and deliver a product for EVERY dollar received. YOUR ORDERS COME BY MAIL AND ARE FILLED BY E-MAIL, so you are not involved in personal selling. You do it privately in your own home, store or office. This is the EASIEST marketing plan anywhere! It is simply order filling by email!

****

The product is informational and instructional material containing the secrets on how to open the doors to the magic world of E-COMMERCE, the information highway, the wave of the future!

PLAN SUMMARY:
(1) You order the 4 reports listed below ($5 each) which come to you by e-mail.

(2) Save a copy of this entire letter and put your name after Report #1 and move the other names down.

(3) Access Yahoo.com or any of the other major search engines to locate hundreds of bulk email service companies (search for "bulk email") and have them send 25,000 - 50,000 emails for you (amount $49+)

(4) Orders will come to you by postal mail -simply email them the report they ordered.
~~~~~~

Let me ask you - isn't this about as easy as it gets?

****

YOU CAN START TODAY-JUST DO THESE EASY STEPS:

STEP #1: ORDER THE FOUR REPORTS

Order the 4 reports shown on the list below (you can't sell them if you don't order them) For each report, send $5.00 CASH, the NAME & NUMBER OF THE REPORT YOU ARE ORDERING, YOUR E-MAIL ADDRESS, and YOUR NAME AND RETURN ADDRESS (in case of a problem) to the person whose name appears on the list next to the report. MAKE SURE YOUR RETURN ADDRESS IS ON YOUR ENVELOPE IN CASE OF ANY MAIL PROBLEMS!

Within a few days you will receive, by email, each of the 4 reports. Save them on your computer so you can send them to the 1,000's of people who will order them from you.

STEP #2: ADD YOUR MAILING ADDRESS TO THIS LETTER
a. Look below for the listing of the four reports.

b. After you've ordered the 4 reports, delete the name and address under Report #4. This person has made it through the cycle.

c. Move the name and address under REPORT #3 down to REPORT #4.

d. Move the name and address under REPORT #2 down to REPORT #3.

e. Move the name and address under REPORT #1 down to REPORT #2.

f. Insert your name/address in the REPORT #1 position.

STEP #3: Take this entire letter, including the modified list of names, and save it to your computer. Make NO changes to these instructions. Now you are ready to use this entire email to send by email to prospects.

Report #1 will tell you how to download bulk email software and email addresses so you can send it out to thousands of people while you sleep! Remember that 50,000+ new people are joining the Internet every month. Your cost to participate in this is practically nothing surely you can afford $20 and initial bulk

mailing cost. You obviously already have a computer and an Internet connection and email is FREE!

There are two primary methods of building your down-line:

METHOD #1: SENDING BULK EMAIL. Let's say that you decide to start small, just to see how it goes, and we'll assume you and all those involved email out only 2,000 each. Let's also assume that the mailing receives a 0.5 response. The response could be much better. Also, many people will email out hundreds of thousands of programs instead of 2,000(Why stop at 2,000?) But continuing with this example you send out only 2,000 programs. With a 0.5% response, that is only 10 orders for REPORT #1. Those 10 people respond by sending out 2,000 programs each for a total of 20,000. Out of those 0.5% 100 people respond and order REPORT #2. Those 100 mail out 2,000 programs each for a total of 200,000. The 0.5% response to that is 1,000 orders for REPORT #3. Those 1,000 send out 2,000 programs each for a 2,000,000 total. The 0.5% response to that is 10,000 orders for REPORT #4. That's 10,000 $5 bills for you CASH!!!

Your total income in this example is $50 + $500 + $50,000 for a total of $55,550!!!

REMEMBER FRIEND, THIS IS ASSUMING 1,990 out of 2,000 PEOPLE YOU MAIL TO WILL DO ABSOLUTELY NOTHING AND TRASH THIS PROGRAM! DARE TO THINK FOR A MOMENT WHAT WOULD HAPPEN IF EVERYONE, OR HALF SENT OUT 100,000 PROGRAMS INSTEAD OF 2,000. Believe me, many people will do just that, and more!

METHOD #2 - PLACING FREE ADS ON THE INTERNET

Advertising on the Internet is very, very inexpensive, and there are HUNDREDS of FREE places to advertise. Let's say you decide to start small just to see how well it works. Assume your goal is to get ONLY 10 people to participate on your first level. (Placing a lot of FREE ads on the Internet will EASILY get a larger response) Also assume that everyone else in YOUR ORGANIZATION gets only 10 down-line members. Look how this small number accumulates to achieve the STAGGERING results below:

1st level--your first 10 send you $5.......$50

2nd level-10 members from those($5x100)....$500

3rd level-10 members from those($5x1000)...$5,000

4th level-10 members from those($5x10000)..$50,000

$$$$$$$$$THIS TOTALS-------------$55,550 $$$$$$$$$$$$$

AMAZING ISN'T IT? Remember friends, this assumes
that the people who participate only recruit 10
people each. Think for a moment what would happen
if they got 20 people to participate! Most people
get 100's of participants and many will continue
to work this program, sending out programs WITH
YOUR NAME ON THEM for years!

~~~~~~

People are going to get emails about this plan
from you or somebody else and many will work
this plan-the question is-Don't you want your
name to be on the emails they will send out?

DON'T MISS OUT!!!JUST TRY IT ONCE!!!***

SEE WHAT HAPPENS!!!YOU'LL BE AMAZED!!!***

~~~~~~

ALWAYS PROVIDE SAME-DAY SERVICE ON ALL ORDERS!

This will guarantee that the email THEY send out
with YOUR name and address on it will be prompt
because they can't advertise until they receive
the report!

~~~~~~

GET STARTED TODAY: PLACE YOU ORDER FOR
THE FOUR REPORTS!

Notes: ALWAYS SEND $5 CASH(US CURRENCY) FOR
EACH REPORT. CHECK NOT ACCEPTED. Make sure
the cash is concealed by wrapping it in two
sheets of paper. On one of those sheets write:
(a)the number & name of the report you are ordering,
(b)your email address, and
(c)your name & postal address.

REPORT #1 "The Insider's Guide to Advertising for
Free on the Internet!

ORDER REPORT #1 FROM:

GARRY DEAN

309 A HUTTO
~~~~~~

KENAI, AK 99611-7829

REPORT #2: "The Insider's Guide to Sending
Bulk E-mail on the Internet"

ORDER REPORT #2 FROM:

DAVID WEBBER

6307 CALIFORNIA AVE. SW

APT # 1B

SEATTLE, WA 98136

REPORT #3: "The Secrets to Multilevel Marketing
on the Internet"

ORDER REPORT #3 FROM:

KATHY BARROW

410 SYCAMORE ST..

CONWAY, SC 29527

REPORT #4 "How to become a Millionaire
utilizing the Power of Multilevel Marketing
and the Internet"

ORDER REPORT #4 FROM:

PAM BARESSI

3321 WILLIAM JOHNSTON LANE #11

DUMFRIES, VA 22026

*********TIPS FOR SUCCESS*************

TREAT THIS AS YOUR BUSINESS! Be prompt,
professional, and follow directions accurately.
Send for the four reports IMMEDIATELY so you
will have them when the orders start coming in
because: When you receive a $5 order, you MUST
send out the requested product/report. It is
required for this to be a legal business and they
need the reports to send out their letters(with your
name on them!) - ALWAYS PROVIDE SAME-DAY SERVICE
ON THE ORDERS YOU RECEIVE. Be patient and persistent
with this program - If you follow the instructions
exactly-results will follow$$$.

*********YOUR SUCCESS GUIDELINES***************

Follow these guidelines to guarantee your success:
If you don't receive 20 orders for REPORT #1 within

2 weeks continue advertising or sending out emails
until you do. Then, a couple of weeks later you
should receive at least 100 orders for REPORT #2.
If you don't, continue advertising or sending out
emails until you do. Once you have received 100
or more orders for REPORT #2, YOU CAN RELAX,
because the system is already working for you, and
the cash will continue to roll in! THIS IS IMPORTANT
TO REMEMBER: Every time your name is moved down on
the list, you are placed in front of a DIFFERENT
report. You can KEEP TRACK of your PROGRESS by
watching which report people are ordering from you.
To generate more income, simply send another batch
of emails or continue placing ads and start the
whole process again! There is no limit to the
income you will generate from this business!

==========

Under Bill S. 1618TITLE III passed by the 105th US
Congress this letter cannot be considered spam as
long as the sender includes contact information and a
method of removal. This is one time e-mail transmission.
No request for removal is necessary.

When you put wires (also the coax) on/through the fiberglass crossboom,
you can just as well use aluminium. The wires may be somewhat thinner
but they still run trough the antenna field and distort the pattern.

The only good way to lead off the wires (unfortunately) is to let them
hang off the rear end of the antenna booms. Look at a picture of the
MASPRO 2/70 crossed yagi system.
Of course this setup is ugly, and a problem in windy areas.

For lightning protection this may be even more problematic, as you will
need to run the protection wires as straight as possible. I have no
good answer to that. Grounding the coax braid isof course the minimum
that you would do in any case (at the feedthrough on entry into the house)

When I had crossed yagis, I used a metal crossboom. It affected the
pattern, but I simply did not want to solve all these problems of the
fiber boom.

2376. DSP-12 - a good P3D 400 Bd TLM receive modem

Newsgroup: rec.radio.amateur.space
Date: 2000-09-30 00:00:00 UTC
From: Bent Bagger <bentbagger@my-deja.com>
Message-ID: <8r4mal$ob3$1@nnrp1.deja.com>
Source record: 8311

Now is the time to dust of that DSP-12 which is sitting on your shelf
and prepare for the upcoming launch of P3D, because here is some good
news for all you DSP-12 owners:

I have uploaded a modified version of the 400 Bd PSK modem for the
DSP-12 to the following URL:
ftp://ftp.tapr.org/dsp/Motorola/dsp56001/dsp-12.

The modification consists of a change to the software so that it sends
514 bytes rather than 512 to the listening program. In this way also the
CRC bytes will get transmitted to the listening program.

The modified modem has been tested by Stacey Mills, W4SM, and he has
this to say about the modem:

"I burned the new eproms and checked out the 400 baud PSK demodulator
with 514 byte capacity. It works very well... Actually, very, very
well. In fact, doing some tests with some 400 baud PSK wave files that
I have generated, having a calibrated background noise, the DSP-12
functioned as well or better than any other modem I have tested"

The file gce201.zip contains these files:

READ.ME
GCE.V40 - Executable that may be downloaded to the DSP-12
GCE.B - PROM image for the B-PROM. Checksum: $1900
GCE.D - PROM image for the D-PROM. Checksum: $5000
GCE.F - PROM image for the F-PROM. Checksum: $4900

Have fun.

I notice that I can hear the bird when its over land much better than
when its over the ocean. With a few fades I was able to here it, at last
measured 3200 miles to the north from brooklyn ny. Mind you I use a
homebrew 16-element yagi for 435MHZ and a 13b2 for transmit. Should I
put my antennas on a elevation rotator to make the over the ocean pass
or just purchase an eggbeater for recieve and a preamp? Or is it even
worth the effort and everybody has the same results...?
PS: If I could recieve it as well over the ocean as I can when it goes
north of me Id be a really happy ham camper.
Any Suggestions ??

If it's an analog L-Band input receiver it might be usable for ATV.
Check the ARRL Repeater Guide for L-Band (1.2 GHz) ATV repeaters in your
area, and give it a try. I couldn't find any reference to it on
Scientific Atlanta's website, so I assume it's an older "consumer"
model. How do you enter the frequency? By satellite name and transponder
number, or can you directly enter the C-Band downlink? All of the analog
receivers I use at work will take either the C-Band input freq,
transponder number, or the L-Band output freq from the LNB.

You shouldn't have any problems working to the East, I myself have
worked stations in the AZORES and Iceland using a rubberduck and HT
from Northeastern Maryland.

When are the Amateuar stations scheduled to go up on the ISS, and which modes will operate first?

This may be the only way to get new HAMS into our hobby in the future!

2387. Phase 3 D AMSAT informations

Newsgroup: rec.radio.amateur.space
Date: 2000-10-03 00:00:00 UTC
From: cesare <cecaprar@tin.it>
Message-ID: <8rddor$i3b$2@nslave2.tin.it>
Source record: 8323

Dear OM,here below the informations from AMSAT regarding the P3D launch :

Phase 3D Launch Status
AMSAT News Service is pleased to report an Arianespace Ariane 5 launch vehicle has successfully delivered a pair of communications satellites into Earth orbit. AR-506 placed the Astra 2B and GE-7 satellites into the desired geostationary transfer orbit after a spectacular launch from the European Spaceport in Kourou, French Guiana.

The launch took place Thursday, September 14, 2000 at 22:54 UTC.

The Astra 2B satellite will broadcast digital TV programs throughout Europe. The GE-7 satellite will primarily provide radio and Internet transmission services for North America and the Caribbean.

Following the successful launch of AR-506, Arianespace and AMSAT-DL have announced that V-507 is scheduled not to occur before November 3, 2000. Aboard this flight will be the AMSAT Phase 3D communications satellite, which is now undergoing final preparation at the Kourou launch site.

According to AMSAT-DL Executive Vice President Peter Guelzow, DB2OS, who is leading the launch team, the advance members of the launch team arrived in Kourou on September 9th. Most importantly, they have ascertained that Phase 3D appears to be in excellent condition.

Tests of Phase 3D's systems are now underway, including charging of the satellite batteries. The launch team has successfully performed pressure tests on the propulsion systems and are now preparing P3D for RF testing.

AMSAT-NA Executive Vice President Robin Haighton, VE3FRH, informed ANS the Phase 3D launch team is awaiting the provision of electronic mail in Kourou which will enable more frequent bulletins to be provided.

Stay tuned to ANS for additional bulletins from AMSAT, the official source for information on the Phase 3D Launch.

[ANS thanks AMSAT-DL and AMSAT-NA for this information]

Best regards and hope to meet you on the satellite soon. 73 de I2JZ, Milan, Italy

Only for when it achieves final orbit. That is likely a year away. The intermediate orbits between now and then will have keps adjusted weekly for what are anticipated to be fairly substantial changes. It won't be in the same place in the sky every 48 hours over North America for quite some time.

Now now ...I wouldn't say that.
Don't give up on Ham Radio just because of the present licensing
format....and the present leadership. Ham Radio may still become an
educational technical hobby in the future as it was in the past.

Hams need more license classes and/or technical endorsements.

Bob Wex w2ilp (Increase License Potential)

Today you can go to a gas station and find
the cash regisdter open and the toilets
locked. They must think that toilet
paper is worth more than money.
--Joey Bishop--

Enuf of this toilet humor. Renew your Ham
license and as for toilet paper...flushit!

I had the same problem here in South Florida. When I called FPL and told them of the problem they did not know what to tell me, What you do is ask for the Radio Interference Department, First they send out in two to three weeks a repairman to check it out, then he in returns gets a hold of the Radioman another two to three weeks after that if their is noisy lines they will repair them. Badly connect lines that have bad connections or are leaking is against the law and they have to fix the problem leaking powerlines are not a problem around my area any more, I now have the phone number to the radio repairman's home. so call your Power Company it may take a while but they have to fix it, Good luck Barry B

With all due respect for nostalgia (I'm 61 myself) it'll never happen; not because of leadership good or bad, but because technology has moved manufacturing and cutting edge research beyond most individuals' resources. Time was, Hams were building almost all their own gear and pushing the envelope of comm's technology but now integrated circuits require a $million investment to produce the first one, after which they're a penny apiece. Sure, I could build a 1940's technology rig and many do just for fun, but it'll likely cost more for the parts than a new "appliance" rig that's far better. So, why demand that kids learn how to design and build antique gear when 99% of them -and us- will never do that (again)?

No, the future of Amateur Radio, if it has any future at all, lies in providing better personal and recreational communications for enough people to provide the political clout to keep the Ham bands dedicated to that purpose.

Most CBrs are prolly interested in traffic and smokey reports but most of the ones on these NGs are more serious communicators, many doing the same things hams do albiet illegally .. to everybodys loss. That's why I encourage these CBrs to become Hams and Hams to lobby for removing artificial barriers to them doing that. My $0.02

Anyone who thinks that the AMSAT program is just a bunch of amateur wanna be's fiddling around; in over their head, should look at the AMSAT website pictures of what's taking place right now in Kouru on P3D. It truly IS rocket science. Note the fueling process with N2O4 in a sealed clean room, with technicians (AMSAT hams) wearing sealed suits. (Nitrogen tetroxide is a poisonous oxodizer) If this sat makes it up OK and works for at least a reasonable period of time, it (IMHO) will be ham radio's finest hour as a technical hobby/service.

Sonic Organism Infects Web

Salt Lake City, Utah - A new sonic organism, Tapegerm, is infecting the world wide web. In only 4 short months, Tapegerm has grown to include 20 diverse artists and been featured on the main page of FranceMP3.com. A musical collective of 20 artists, Tapegerm creates original music using loops and sounds contributed by fellow Tapegerm members and visitors to their web site. Tapegerm is a cohesive, but somehow anarchic collective focused exclusively on crafting collaborated music entirely in cyberspace.

Tapegerm began as an experiment with re-mixing hometaper music at homemademusic.com and quickly evolved to embrace and infect the Web. Like a living organism, there is no central organization, no founder, the membership is continually evolving and each member is equally important to the life of the whole. Tapegerm artists create 'Germs", musical loops that spread, multiply, and mutate, and assemble them into musical collages. Available on the internet, the music runs the gamut of electronic genres, from ambient electronic to techno to noise to experimental.

Internet based reconstructive music is in the embryotic stages of becoming a long lasting artform and Tapegerm is at the forefront of this movement. We've all seen what the mp3 format has done to change the world of music, but we've only begun to see the potential that the internet affords to creative individuals who are banded together in ideas, but separated by geographies. A sonic organism such as Tapegerm exemplifies the democracy and "creative frontier" hype that the internet has been billed as being, but often falls short of.

Visit tapegerm.com for a look at the group's progress, listen to new mixes happening nearly daily, upload your own sounds for the group to manipulate and employ in new recordings, and get hold of three exceptional CD's exploding from the combined creativity of 20 artists.

Well, I finally did it. I signed up for the 50K Club! You can too.
It's only $10 in PayPal money, so I said "What the heck!"

This is brand new, and all you need to do is sign up 10 people who sign up 10 people, etc. If you can do that then you should have $50,000 in your PayPal account before it's all over.Yes,I said FIFTY THOUSAND DOLLARS!

Start now, and whatever you earn is put directly into your PayPal account by your downline. Nobody receives money ahead of you. Someone joins, and five minutes later it's in your account! It's unreal!! Fill your checkbook!! No more building downlines for someone else. What you earn you get! You are thinking maybe you have seen a program like this one before?? You haven't!! There hasn't been one like this before. What makes this Club different is that it works!

Guaranteed!!You start getting paid with your first sign-up. Plus, every sign-up and every payment is verified so no one can cheat or short-change the system! YOU WILL GET PAID! How much money you make is up to you! Need $10,000 in the next 10 days?

You can have it if you get going immediately! You must take a look at this and get started NOW! Take control TODAY!

This is brand new, so join RIGHT AWAY. You don't want your friends, neighbors or family to join under someone else, do you?

If you don't already have a PayPal account, you will need one. You can apply for one and not only is it FREE to set up, they even PAY YOU $5.00 for opening a new account. I'll send you the necessary info!

Quote: "Even if you are on the right track, you will get run over if you just sit there" [Will Rogers]

Matt,

you may be interested in ESA's occasional rebroadcast of NASA TV and
their coverage of space relevant events on Eutelsat 2 and Intelsat Star.

Refer to: http://television.esa.int

Regards,

Edgar

I think an organization over 30 years old with nearly 20 operational
sattelites in Earth orbit can hardly be called "a bunch of amateur wannabes"

I am looking for a good antenna to be able to work the LEO birds, I do not have AZ/EL control because I do not have a rotar, I place the antennas on my roof in a fixed position..

I am wondering if anybody else does this and has any decent designs...

If so could you please reply to this post and leave an address for them...

Radio Meteor Observation Bulletin No. 86 October 2000

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Paseo Bonanova, 8 Barcelona (02 07'E, 41 24' N)
Frequency: 48.24715 MHz.
Transmitter Location: Biedenkopf C2 TV, Video Frequency 48.250 MHz,
ERP 100 kW, Azimuth 90 +/-65
Antenna: 3 element Yagi Azimuth 200 deg (NE), elevation 20 deg
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (500 Hz) and fed into the PC in real time.
Data sampling system: own written software "MSD" with sound card.

------------------------------------------------------------------------
```

Observer: Jean-Louis Aillaud
Location: Sainte Clotilde, R&#65533;union Island (55 29' E, 20 52' S)
Frequency: 87.7 MHz, 89.7 MHz (empty frequency for coincidence)
Transmitter location: Madagascar - 850 Km
Antenna : 3 elements Yagi FM horizontal polarisation
elevation 90 deg (zenith), astronomical azimuth: 114 deg (=West)
Receiver 1: FM tuner Technics ST G 450 L (on 87.7 MHz)
Receiver 2: FM tuner TEAC TR 400 (on 89.7 MHz)
observing method: Electronic interface on LINE output audio signal are fed in
COM2: of PC (1) 100 MHz and COM2: of PC (2) 200 MHz
METEOR V4.0 processes the signal and records on hard disk the time
of the events.
COLORGRAMME V.2 for examined DATA and generates RMOB bulletin

automatically
METEOR parameters: threshold 10 for 87.7 89.7 MHz

. - = no observations made
. * = Interference
. + = 1/2 hour observation only

Mike Boschat

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi (x form), 4 elements, astronomical azimuth 270 deg
(= E), elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB.
SWR of antenna alone at 66.5 MHz: 1.4/1 (good to very good),
measured with MFJ/259P SWR analyzer (HF-VHF 1.8 MHz to 170 MHz)
on Sep 28, 1998.
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the Ghent University format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

```

Notes:
. ? probably affected by sporadic-E, tropo, direct reception.
. * warning for relative high number of long duration reflections,
an indication for potential stream activity.
. local time = UT + 2 hours

Maurice De Meyere

Location: Astronomical Observatory, Ghent University, Belgium
(ED50 coordinates: 3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation 20 deg
Antenna amplifier: 10 dB gain
narrow band resonance lambda/4 antenna filter
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Note:
. counts for the 26 September 09, 10, 11 and 12 hrs UT are incomplete
due to mains power supply cuts.

Dave Swan

Observer: Pierre Terrier
Location: Canet, France (3 36'E, 43 41' N)
Frequencies: 93.7 MHz (changed since previous report)
Transmitter Location:
93.8 France Musique Eyne (66) public service
93.8 France Musique Osseja (66) public service
93.8 France Culture Port Vendres (66) public service
93.8 France Musique Font-Romeu (66) public service
93.8 BFM Marseille (13)
Antenna: 6-element Yagi FM, horizontal polar.
azimuth 0 deg (N-S), elevation 90 deg. (zenith)
Pre-amplifier: home made, gain 15 dB, Nf < 2 dB
Receiver: Tuner FM Continental Edison digital synthesiser TU 9945
Observing method: Electronic interface on LINE output audio signal are fed in
COM1: of PC IBM 386 25 MHz.
METEOR v 4.0 version processes the signal and records on
hard disk the time of the events.
METEOR parameters: THRESHOLD = 16
COLORGRAMME v 1.5 generates RMOB bulletin automatically

Pierre Terrier

--------------------------------------------------------------------------------
Observer: Garfield Tsao (BM2EQB)
Location: LonTan Observatory
LonTan, TauYan, Taiwan R.O.C. (121 14'37" E, 24 52'54" N by GPS)
Frequency: 50.0169 MHz USB mode 3 kHz width.
Antenna: Comet made 50 MHz Yagi HB 4 element (gain 10.3 dBi)
astronomical azimuth 225 deg (=NE), elevation 7 deg.
Transmitter: MIYAZAKI University Japan, USB mode, 50 W (24 hours),
distance about 1225 km from Lon Tan.
Receiver: Icon PCR-1000 computer controlled all band receiver
```

Sensitivity: 0.25 uV for 10 dB S/N for USB mode
Observing method: the beacon 920 Hz voice signal (by FFTDSP) is
received by a low frequency filter (900 Hz)and fed into
the D/A converter and computer in real time.
Data sampling system: using an 8 bits A/D card to PC/AT and Qbasic program
with 1/8 second sampling interval to store the> 1.0 s reflections.

September strong and long lasting echoes list

LT strength duration
dBi s
Sep 9 23h43m > 20 > 60
23h49m > 20
04h37m > 20
06h10m > 15 > 120

16 08h53m > 20
24 07h48m > 120

Notes:
. "E" = weak E layer
. "I" = background noise interference affected the normal echoes
. this month, there were less total echoes and long lasting echoes
than during the same month of previous years.

Garfield Tsao

Observer: Ilkka Yrj&#65533;l&#65533;
Location: Finland (26 35' E, 60 54' N)
Frequency: 88.7 + 88.8 MHz
Receiver: Salora SRP-22 modified, narrow band FM (B=15 kHz)?
detected signal level >-122 dBm.
FM detection, no pulse noise rejection required.

Antenna: 2-el. Yagi, G=4 dBd to SW, azimuth 45 deg (SW), polarisation H.
Data sampling system: threshold triggering, sampling rate 32 ms.
Computer logs total hourly elapsed reflection time, number of
triggers for the hour, the longest time the signal was
continuously above detection level for the hour.
Data on major showers available in the Compact MS-Soft format.
Software for viewing available from
www.saunalahti.fi/~oh5iy/radio50.zip (754 K).

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of

existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

Dear Friend

You'll love this

Imagine your website having thousands... even million
of visitors every week.

Would that help you earn more money?

Then get the latest tactics to pull in visitors to your
website like a giant magnet.

Download Superior Marketing Tools & Tactics
Software... It's 100% FREE!

You will discover how to reach 10 Million people for just
ten dollars per million.

A step-by-step, easy to follow, directions on how to pull
over 1000 people per day to your website FREE... (you
won't
spend a dime in advertising costs).

You'll learn how to backdoor your way into the 3 best
search engines... these search engines are
responsible for 89%
of all search engine traffic.

You'll get a tool to determine what keywords you
should use BEFORE you submit your website so you'll
get the most
visitors to your website once your listing appears.

You'll get an instant Meta-tag tool to get a higher
ranking in the search engines.

Our secret to maximize your profits... something most
people would never know about.

What Ezine's are best to advertise in to get the most
from your advertising dollars.

Viral advertising tactics that most people never thought
of.

How to use free incentives as a lead generator.

$195.00 worth of secret reports and how to use them to
attract visitors to your website by the truckloads.

And More!

I'd have a look at the Eggbeater 2 antenna,
I made one for 137mhz from his design and it's one of the best antennas
I've used

2411. KLM ANTENNA SPACING

Newsgroup: rec.radio.amateur.space
Date: 2000-10-08 00:00:00 UTC
From: ke2ls@attglobal.net
Message-ID: <39E0FD51.588EFBA1@attglobal.net>
Source record: 8346

I have never operated satellites and am in the process of setting up my antenna system.

I have the KLM 2M-22C and KLM 435-40CX antennas. These will be mounted on the cross arm of a Yaesu 5500 rotator AZ/EL.

What is the spacing between the two antennas on the cross arm. The antennas and rotator will be mounted on a 16' tower.

Thanks for the assistance

Paul Mierop
KS2K

I doubt the spacing will make much differance. I have a similar setup and used a 10 foot piece of pvc with a wood closet pole in it. Put the antennas near the end and slid the pipe in the rotator to make it balance. You just want to get them as far apart as you can to keep the rf out of the other band as you will normally be trying to receive while you are transmitting. A friend of mine had his set up the same but used a 7 foot pvc pipe.

Not sure what you are going to use to track the setup with but if you don't have a computer controled system you might want to look at the Fodtrack system that you can download from amsat.org. Small interface that plugs into the parallel port. The program is not the greatest but does get the job done. I usually run it to do the actual antenna pointing and another one to look at the time and position of where the sat is.

Rationalization!!!

I don't expect many hams will be able to custom build their own integrated circuits...although some have been instrumental in specifying I.C.s that have become commercial. Most old Hams never blew their own vacuum tubes either. Today you can buy kits that have been designed by members of TAPR, which exceed or preceed what may be available from Japanese manufacturers. We can buy I.C.s which are cheaper and more versatile than vacuum tubes were and experiment with them using low voltage batteries instead of potentially dangerous higher voltage power supplies. We can take advantage of the many cheaply available electronic components that are now even sold in Radio Shack, such as LEDs and opto-isolators.
If you have not been able to keep up with the solid-state age - that is your problem...but don't spread any fear of modern technology. I suggest that you read some of the booklets that were written by Forest Mimms for a starter. I am 67 years old but I never stop learning about electronic hardware.

> No, the future of Amateur Radio, if it has any future at all, lies in
> providing better personal and recreational communications for enough
> people to provide the political clout to keep the Ham bands dedicated
to
> that purpose.

Never happen...There is more "recreational communication" available via
the Internet than Ham Radio can ever provide. Hams can not expect to
be a very large percentage of the population in the future. Hams can
seek quality but not quantity. Hams can comply with providing the
kind of technical people who are an asset to the USA, as well as
themselves.

> Most CBrs are prolly interested in traffic and smokey reports but most

>
> KA3DWW

Do you want Hams to only think like CBers? Or do you just expect CBers
to think like non-technical Hams? At any rate you must start to think
about what the difference is between CBers and Hams. You can start by
reading the Basis and Purpose of Ham Radio in FCC Part 97. Why do you
think that Hams are the only group of operators who are permitted to
build and service their own equipment?

I encourage techies to be Hams and CBers to remain CBers unless they
want to learn to be techies. I understand the difference between CBers
and Hams. Those who do not; will either kill Ham radio for everyone or
convert it into Citizn's Multi-Band (CMB), which for my $.02 is about
the same thing.

Hams need MORE license classes and/or endorsements.

Hi All

Just got LogSatv5.2 going on Win_95/98
and is now Y2K complient with patch 5.2.47
from the LogSat site. The programs works
perfectly using these OS. Very usfull features.
I do however need to use the program under
Win_3.11 on my old 486DX2-66 with 20meg RAM.
The patch fails to install due to a 32bit
file which is supplied called "NTUTIL.EXE"
I am using Win32s v1.30.166 and v1.30.172
and have tried both the 486 and a pentium
with still no luck. I am trying to get help
from the LogSat support people but does anyone
else have the same problem?

Thanks and 73's John ZL2TWS

2420. New Hamtronics radio for WxSat

Newsgroup: rec.radio.amateur.space
Date: 2000-10-09 00:00:00 UTC
From: tegwilym@my-deja.com
Message-ID: <8rt6jo$g0j$1@nnrp1.deja.com>
Source record: 8255

Ok, after playing with a couple scanners, a turnstile antenna, pre-amp and finally building a QFH antenna for the attic, I bought one of the Hamtronics radios. I arrived last friday, and I have it hooked up and running now. WOW!!! This little radio works great! I thought my modified Pro-2038 was doing well, but this one blows that one away. I have a few new images up on my web page, and also added another page to the site that shows how my station has evolved in the 2 months I have been doing this.

2421. Icom IC-910 - More Details

Newsgroup: rec.radio.amateur.space
Date: 2000-10-09 00:00:00 UTC
From: curt_chambers@my-deja.com
Message-ID: <8rt8vb$i36$1@nnrp1.deja.com>
Source record: 8256

Found some additional info on the new radio over on Icom's Japanese website. Some of the highlights as best as I could make out:

Main & Sub-Bands are completely independent in terms of operation and complete full duplex operation is possible.

In satellite mode the downlink freq. is set in the main band and the uplink in the sub-band automatically. There is a doppler shift control / reverse tracking and all of the usual satellite goodies. There are 10 satellite memories.

It also appears that two TNC's can be hooked up - one to the main band and one to the sub-band.

In Japan at least the 1200mhz unit (UX-910) is optional.

Memory channels: 99 per band unit - so if the UX-910 was installed you would have a total of 297 memories. Each band unit has 6 band-edge memory channels, 1 call channel per band as well.

Scanning is possible via:

Program Scanning (band edge to band edge)

Memory Scanning

Mode Scanning

Tone Scanning

Scanning is independent in either main or sub-band.

Other Misc things:

The PA utilitzes bipolar transistors in parallel.

At least in Japan the price/value equation is supposed to be very good given where these rigs were typically in the past. The "list" price appears to be just under $1400 US.

The unit is small....241mm(W) x 94mm(H) x 239mm (D).

9600bps packet ready.

UT-106 DSP UNIT - and if I am reading my translation correctly two DSP units can be installed - one for the main band and one for the sub-band.

Optional CW narrow filters - one for the main band and one for the sub-band.

Memo-Pad Function that allows a temporaty place to store freq/mode details while operating.

RF attenutation is independent in main & sub-bands.

VOX, Noise Blanker, IF Shift

The basic IC-910D appears to be a 50watt radio (both 2meters & 70cm) out of the box with a modification possible to get 100 watts on 2 meters and 75 watts on 70cm. They also have a IC-910 that appears to be a 20 watt model across the board...which if I remember correctly Icom has done this lots in the past with the Japanese market products. The optional 1200mhz unit has 10 watts max output.

If you have anymore specific questions I'll be happy to try and help just email me.

You say on your website Satsignal only works with 10% of your
recordings...
There are some options to fiddle with, such as sampling rate, you see
quite easily if the picture
is skewed. Personally I could not live without satsignal, first of all the
fake coloring is great
second - it corrects for too low / too high signal input , almost every
picture on my page
http://www.gravitywell.org/wefax.htm is processed with satsignal, just not
the first few ones,
I even threw most of my old pictures away.
Anyways, it works like a charm on all (at least my) recordings, try
playing with the settings...

I was only able to process about 10% of the files with the scanner radio I was running. Now that I got the Hamtronics I can process about 99% of them with no problems! There is a few images that just didn't record well enough becuase of a low pass or something, but SatSignal has done a great job with the colors. I haven't had to change anything on it with this radio.

Thanks for the comments! My next plan is to work out a way to display the pictures better rather than just a long list of daily updates. I might try something with some thumbnail images, but that is always a lot of extra messing around to make the small and large images. I'll figure something out!

2427. Re: Homebrew 70cm Antenna

K50E's web site contains quite explicit instructions on making eggbeaters. I made a 2 meter one before I discovered K5OE's web site by following the ARRL Antenna Handbook. I basically downsized their loop design for HF. It had the advantage over K5OE's design in that it didn't require 93 ohm coax. A quarter wave section of 75 ohm line provided a matching transformer from the 100 ohm feedpoint to the 50 ohm coax. A quarter wave of coax is a lot easier to measure at 7 MHz than at 146 MHz but it worked.

Anyhow, I run 60w SSB and 30w CW into the antenna and can get quite good signals into RS13, FO29, and FO20 at ranges out to 2500 KM or so.

Good luck,
Tom

Hi Franko,

> It is possible to find one new (updatet) full frequency list from all
> amateur active sats

Here are a couple of web pages which may help you in your search for
information:

http://www.amsat.org
In addition to all the information on their web page, their weekly
amsat bulletin provides the frequency and operational status of all
amateur satellites in service.

http://www.heavens-above.com
This page is mostly for visual tracking of orbiting objects. They
have added a section showing amateur satellites which will pass within
range of your specified QTH for each 24 hour period. That page includes
frequency information as well.

I hope this helps,

>
You miss my point, Bob. Sure, you can build stuff that performs half as
well as off-the-shelf gear for twice the cost, but there are too few
folks wanting to do that to keep FCC from reallocating our spectrum.

> I don't expect many hams will be able to custom build their own
> integrated circuits...(but) We can take advantage of the many
> cheaply available electronic components that are now even sold in Radio
> Shack, such as LEDs and opto-isolators.

Experiment with them to discover what? What kind of gear are you going
to build out of this stuff? A morse decoder that won't work because most
fists are too poor to copy? An archaic QRP rig? With all due respect for
TAPR, how are you going to advance the art by breadboarding somebody
else's design using Radio Shack components?

> If you have not been able to keep up with the solid-state age ....

I am a senior engineer in a Government lab evaluating off-the-shelf
(COTS) hardware for applicability to military needs because - guess what
- not even Uncle Sam can afford to custom design and build his own
hardware any more. It isn't cost-effective and the gear is outdated
before we can get it to the fleet.
>
> Never happen...There is more "recreational communication" available via
> the Internet than Ham Radio can ever provide. Hams can not expect to
> be a very large percentage of the population in the future. Hams can
> seek quality but not quantity. Hams can comply with providing the
> kind of technical people who are an asset to the USA, as well as
> themselves.
>
I fear your statements re: the internet and population are true. In that
case, Amateur radio has no future and we may as well turn over 2-meters
to the CBrs
and the HF bands to businesses.

As far as hobby homebrewing providing qualified technical people, you must be joking. Tech's who breadboard other peoples' designs are a dime a dozen; or rather $10/hour. In 1950, industry was hungry for BSEE's to design new circuits but now only the best EEs - the top 1% perhaps - are designing circuits for chipmakers and the rest are overpaid techs using those chips like legos. Hell, most are coding software because there are more EEs than real EE jobs! Nothing you can build out of Radio Shack components is going to train anyone to join that 1%. Sorry ....

> Do you want Hams to only think like CBers? Or do you just expect CBers
> to think like non-technical Hams? At any rate you must start to think
> about what the difference is between CBers and Hams.

Hmmm.. we say "roger" and "OM" instead of "10-4" and "good buddy"? ;o) It may be a blow to your self esteem OM, but from my perspective there has been little difference since economics turned us into "appliance hams". Federal law makes CBrs buy COTS equipment; economics makes most hams do likewise. A tiny percent of CBrs violate FCC law to build their own gear; a tiny percent of hams violate economic common sense to do likewise. A few bad apples poison the CB barrel and judging by FCC enforcement logs a few hams do likewise. The major difference I see is that Amateurs properly report the bad apples and help the FCC catch them while CBrs do not, but that could be rectified.

> You can start by reading the Basis and Purpose of Ham Radio ...

" (b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.
(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communication and technical phases of the art.
(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts."

Do you suggest that we are doing these things using Radio Shack components?

> Why do you think that Hams are the only group of operators who are
> permitted to build and service their own equipment?

For the same reason that my grandfather got to fly without taking an FAA exam: because it made sense back then. When the service was established, and radio was in its infancy, amateurs did indeed contribute a lot to the state of the art, both technically and operationally, and morse code was essential to operating proficiency. This is no longer true. Those who have contributed in the last decade or so may have been amateurs by coincidence but they didn't contribute *because* they were amateurs; they contributed because they had access to well funded labs. So, to address your question, the reason we still have the privileges they earned is that we have so strong a lobby that taking away those privileges has been politically unwise ... but that lobby is shrinking.

> Hams need MORE license classes and/or endorsements.

I have a better idea. Let's have just one class with one test: in one week, independently design a transceiver equal in size and performance to the latest COTS transceivers without duplicating any of their designs. That way there won't be so many people "cluttering up" the bands, right? Not even you or I ... :o(

> Does the name Pavlov ring a bell?

Indeed it does. Pavlov demo'd that one could cause a biological response by showing some abstract figure only, and the key is "only", just before the subject got to eat, et cetera. You may also know that porn is defined as that which arouses us sexually. It follows that censorship creates porn by turning otherwise common items into porn by denying us their common view and instead allowing us to see them only just before sex. How about them apples?

This is a call for action for all Hams that want to continue using their MOBILE radios, or even wish to transport their PORTABLE/HANDHELD radios in their vehicles without obtaining a special permit from the Michigan State Police.

On Sept. 27, 2000, Michigan Rep. Mike Kowall sponsored House Bill HB-6012 that amends sec. 508 of 1931 PA 328 (MCL 750.508). Co-sponsors to this amendment are Reps. Cassis, Julian, Shackleton, Birkholz, Howell, Scranton, and Tabor and has been referred to the Committee on Transportation.

Sec. 508 has been completely rewritten.

Subsection (1) states ...shall not either equip a vehicle with a radio receiver, or possess in a vehicle a portable radio receiver that receives...

Subsection (2) does not exempt Hams from the permit requirement as the non-amended sec. 508 did.
Subsection (2) states ...does not apply to a vehicle owned or used by an individual who has obtained a valid permit...
This permit requirement applies to Law Enforcement Officers and Amateur Radio Operators.

This is a bad Bill for Amateur Radio in Michigan on the whole, and especially for those attempting to provide a service to our communities. This is another hurdle which should not have to be jumped by the volunteers that give so much already.

Call or e-mail your State Representative today and let's put a stop to this foolishness. You can find your Representatives number in the phone book or by going to http://www.michiganlegislature.org/ and then scrolling to the "Links to Other Sites" "State House".

HB 6012 reads as follows:

(1) Except as provided in Subsection (2), A person shall not either equip a vehicle with a radio receiver, or POSSESS in a vehicle a portable radio receiver, that receives radio frequencies assigned by the federal communications commission for police purposes.

(2) Subsection (1) does not apply to a vehicle owned or used by an individual who has obtained a valid permit from the director of the department of the State Police on a form prescribed by the director and who is either of the following:

(A) a law enforcement officer certified pursuant to the commission on law enforcement standards act, 1965 PA 203, MCL 28.601 to 28.616.

(B) An amateur radio operator licensed by the Federal communications commission in 1 of the following classes:

(i) technician class
(ii)Tech Plus class
(iii)general class
(iv) advanced operator class
(v)Amateur extra operator class

(3) this section does not restrict or prohibit equipping a vehicle with or using a radar detector.

Violations of this law carry a 1 yr jail sentence and a $500.00 fine.

2440. The search for a gene

Newsgroup: rec.radio.amateur.space
Date: 2000-10-12 00:00:00 UTC
From: analog24@webtv.net
Message-ID: <13101-39E677E2-60@storefull-177.iap.bryant.webtv.net>
Source record: 8274

GENETIC
FACTOR EYED

Biofeedback Systems in Los Angeles, is looking for
volunteers with a rare genetic inheritance, to participate in a
proprietary study.
At present, it is believed that fewer than one person in 400
carries a rare genetic makeup that predisposes them to having better
health than most, a strong immune system, and an unusually high energy
level. Aside from behavioral manifestations such as a generally positive
outlook on life, the principal evidence that this genetic factor is
present, is mirrored in the shape of the eyes.
It should come as no surprise then, that the eyes themselves
would be used to select the people who are nost likely to have this
elusive gene. Individuals selected for this study will be white,
Caucasian, of either gender, and between the ages of 25 and 50.
Compensation will be determined by a collective evaluation of the total
number of applicants selected. Drugs will not be administered as a part
of the study.
The eye contour that embodies the required genetic trait,
has been roughly described as "almond shaped," but this is not an
adequate definition. Exact specifications follow.
Looking in the mirror with the head level, the qualified
applicant will see that the lower half of their eyelid is CONVEX UPWARD,
from the bottom on either corner. The bottom part of the iris will be
partially covered by the lower eyelid (this is important), and there
will be a reasonable symmetry between the eyes on the left and right
side of the face.
Applicants must submit a close-up facial photograph for
evaluation. Since no risk or disease factors have been associated with
this gene, any risk to volunteers in the study is contraindicated.
Interestingly, it is apparent that the "energy gene" as it has been
called, may be dormant in one or both parents, yet it may be actively
transmitted to their children; but it is only infrequently active among
two or more siblings.
If you know of a person, or happen to notice one whose eyes
might qualify them for this study (preferrably among those employed in
the technical community), you may want to share this data with them.
Since so few people are fortunate enough to carry this gene, your only
encounter with one of them may be in a fleeting moment. It would be
wonderful if you had a copy of this announcement with you, and could
share it with a prospect in passing. Alternatively, you could specify
this website and posting date, or perhaps my email address.
They may then contact Mr. Norman Swartz at this

[virus-proof] email address: analog24@webtv.net (It is not generally realized that, because webtv has no hard drive, it is immune to destructive computer viruses.) Or, they may write to: Biofeedback Systems, Post Office Box 8501, La Crescenta, CA 91214. No telephone calls please. Depending upon the number of volunteers selected, applications will be accepted through the end of December 2000, with a possible extension through 31 January 2001. The duration of the study will be a minimum of two years.

When I build stuff it is built according to my own needs and
specifications and well within the parameters of the same hardware
(such as low noise FET front ends as any of the major mfgs can
perovide. My stuff might not look as good aesthetically or be as
compact as commercially mass produced stuff but it serves my purpose
and is easier to service with the tools that I built it with. I don't
care how few Hams can build stuff but I do care if we forget to try to
teach those who might be interested in building stuff how easy it is to
do so. The costs are not excessive and are frequently less than the
cost of finished gear. I buy newly developed chips and other
components in small quantities of what I need from Digi-Key or Mouser.
I am a pack rat and save lots of parts. I salvage parts from old used
equipment. I buy stuff at HamFests. In short I know what I may be
needing and I buy it of canabalize junk to get it. I have many low
voltage power supplies on hand for experimentation and can easily
duplicate them from parts on my shelf. Often the junk has been built to
MIL standards and the parts are of high quality....sometimes higher
quality than mass producers might use. I test new circuits on
solderless contact boards before building the finished product. For RF
circuitry I don't always use PC boards. Sometimes I use a matal ground
plane in which I mount teflon standoff terminals for point to point
wiring. Sometimes I do use stripline PC boards...but only when this is
necessary.

Some say that Columbus did not discover America because there were people already here. If I build a new circuit using a 555 chip and some blinking LEDs I might not be discovering anything that others have not been able to discover....but it is for me a discovery; Just like when I discover where I left my can keys after I lost them...it is a satisfaction!

> What kind of gear are you going
> to build out of this stuff? A morse decoder that won't work because most
> fists are too poor to copy?
Morse decoders that won't work may be troubled by their software. This is a problem that is evident in the commercial decoders as well.

> An archaic QRP rig?

It is not archaic if it meets or beats the specs that a commercial rig can provide. There are only QRP xmitters...Receivers IMHO are tasked to do the same job in any case.
> With all due respect for
> TAPR, how are you going to advance the art by breadboarding somebody
> else's design using Radio Shack components?

If I find any bugs I would report them to TAPR. To be honest I have not built any TAPR kits...but I do read TAPR literture and may try building their kits or duplicating them in the future. I am especially interested in Spread Spectrum and if all goes well with others who use it I may be building some stuff that can communicate with them...but first I must learn as much as will be needed. I can not get it all from text books such as Dixon...nor fro ARRL pubs. To boil it down to actual design with real components I must underrstand all that is needed first. Now...even if I never live to actually building any SS gear, I can enjoy planning to do so...Just as some people enjoy planning to build a house or garder even though they may never be able to astually do so. I can build "breadboard" circuits that would be part of the finished product and see if they can function properly. Even if I don't build an entire working system I can get some self satisfaction out of that and I can understand the difficulties involved for others and appreciate their innovation if my circuits fail as well.

I know! I worked on many government projects as an EE. You are preaching to the chior on that point...but my cellar is not a government job operation and I don't have to work under the burocracy of government regulations and MIL specs...nor do I have to satisfy a corporate leadership that often fights innovation. That is the beauty of being a Ham experimenter. It is legal to build anything except weapons of distruction as long as you only test it on the air within the rules of Part 97. You can build a lot of stuff that they won't let you build at work. I have tried out some ideas at home in the past that I later did use in the designs of test equipment that I was able to use at work. A m,issing pulse detector which can sync up serial pulses was tested by me at home before I promised to design a serial to parallel digital converter at work. If I had not tested the circuit on my own I would not have been able to promise that I could design the converter at work because I wouldn't have been confident that it would work. I also use crude temperature testing and troubleshhoting at home...a heat gun for hot and freon cold spray for cold. I couldn't use these methods at work wher the bureaucracy might insist on more precise work to be done by environmental testing engineers in another department before proceeding to build the end product. Such testing could take months or even years...just as incoming inspection of each component often does.

> to the CBrs
> and the HF bands to businesses.

AMATEUR RADIO has a FUTURE...If and only if hams behave as real hams. If they want to just be fun operators and customers for Japanese manufactured products it has no future. Eventually the Hams will discover that they are being led by the Japanese designers who decide on what is going to be made available to them and advertised rather than the hams themselves. Hams can never survive solely as users. Even the ARRL may eventually realize that. I hope it is not going to be too late for them to do so.

>

> designing circuits for chipmakers and the rest are overpaid techs
using
> those chips like legos.

Yep...I've used chips and components like LEGOs. Some techs can do
that and some can't. Some degreed EEs can do that and some can't. And
worst of all; Some engineering managers not only can't but don't know
how to get any value out of those who can.

> Hell, most are coding software because there are
> more EEs than real EE jobs! Nothing you can build out of Radio Shack
> components is going to train anyone to join that 1%. Sorry ....

I disagree...but I would include Digi-Key and/or Mouser parts with the
RS parts.

think
> > about what the difference is between CBers and Hams.
>
> Hmmm.. we say "roger" and "OM" instead of "10-4" and "good buddy"? ;o)

Yeah...but lingo is not the same as innmovation.

> It may be a blow to your self esteem OM, but from my perspective there
> has been little difference since economics turned us into "appliance
> hams". Federal law makes CBrs buy COTS equipment; economics makes most
> hams do likewise.

Not economy...I beg to differ...but ARRL's economy which sees Hams as
users of their pubs and customers for their advertisers and not as
radio experimenters. That is the only reason that I bad mouth the
direction being taken by most present Ham leaders.

> A tiny percent of CBrs violate FCC law to build their
> own gear; a tiny percent of hams violate economic common sense to do
> likewise.

Not economic common sense in the case of Hams...just Hams who have been
taught to emphasize the wrong basis and purpose for the entire hobby.

> A few bad apples poison the CB barrel and judging by FCC
> enforcement logs a few hams do likewise. The major difference I see is

> that Amateurs properly report the bad apples and help the FCC catch
them
> while CBrs do not, but that could be rectified.

Sometimes CBers do help to locate the bad apples.. Those who run only 5
watts don't always go along with those who run 500 watts.

> > You can start by reading the Basis and Purpose of Ham Radio ...

> (d) Expansion of the existing reservoir within the amateur radio
> service of trained operators, technicians, and electronics experts."
>
> Do you suggest that we are doing these things using Radio Shack
> components?

Not entirely...but it might be a starting point and is far better than
just assuming that the best Hams are the one's whose ECONOMIC condition
permits them to buy the best Japanese boxes that their money can buy.
There are some Hams who can't even put a BNC connector on a peice of
coax. BNC connectors and coax cable are available in RS for tjhose who
want to practice doing so themselves. I suggest that they don't buy
the "solderless" type connectors that are ment for audio appliances.

> > Why do you think that Hams are the only group of operators who are
> > permitted to build and service their own equipment?
> >
> For the same reason that my grandfather got to fly without taking an
FAA
> exam: because it made sense back then. When the service was
established,

AHH!...but it still makes sense for many Hams who don't think like you
do.

> and radio was in its infancy, amateurs did indeed contribute a lot to
> the state of the art, both technically and operationally, and morse
code

Spread Spectrum is now in its infancy. The interleaving of many
digitized duplex signals within the bandwidth formally reqiired for one
simplex signal is now proven possible commercially. This is in its
infancy as far as Ham Radio goes. I doubt if the Japanese designers
will introduce us to it as long as they can continue to sell what is
basically the same stuff that has been around for 30 years. It is up
to Hams themselves to adopt this technology to Ham Radio.

> was essential to operating proficiency. This is no longer true. Those
> who have contributed in the last decade or so may have been amateurs

by
> coincidence but they didn't contribute *because* they were amateurs;
> they contributed because they had access to well funded labs. So, to
> address your question, the reason we still have the privileges they
> earned is that we have so strong a lobby that taking away those
> privileges has been politically unwise ... but that lobby is
shrinking.

It is now easier to devise your own pulse generator from RS parts and
to adapt a computer to be a pulse analyser than it ever was in the
past. Innovation may be better than a well equiped lab for the Hams
who can make use of what they have.

> > Hams need MORE license classes and/or endorsements.
>
> I have a better idea. Let's have just one class with one test: in one

> to the latest COTS transceivers without duplicating any of their
> designs. That way there won't be so many people "cluttering up" the
> bands, right? Not even you or I ... :o(

Nah...I don't expect all Hams to be receiver designers...Many might
have more fun designing companders or digital filters or whatever other
specialty they seek to acquire. Some will still be Hams just to
collect DX QSL cards and that is OK as long as they are constantly
trying to modify and update existing antennas, hardware front ends and
software modes to improve their efficiency.

> > Does the name Pavlov ring a bell?
>
> Indeed it does. Pavlov demo'd that one could cause a biological
response
> by showing some abstract figure only, and the key is "only", just
before
> the subject got to eat, et cetera.

Me thinks that you may understand Pavlov's experiment but remember that
it wasn't done on people. You could be mixing up Pavlov with Skinner.
Skinner worked with other animals.
Pavlov rang a bell every time his dogs were fed...After a while, the
dogs began to salivate after a bell was rung, even when they were not
being fed anything. I apply Pavlov's experiment to Hams as
follows:...As you said, in the old days Hams had fun building radio
transmitters and working other Hams on the air...Now they have been
conditioned to have fun just by working other Hams on the air, by
advertisements...But the real meat and potatoes of Ham Radio is
gone...and if this doesn't get turned around Ham Radio will surely go
to the "Pavlov conditioned" dogs rather than thinking humans.

> You may also know that porn is
> defined as that which arouses us sexually. It follows that censorship
> creates porn by turning otherwise common items into porn by denying us

> their common view and instead allowing us to see them only just before
> sex. How about them apples?

Each of us may have any kind of opinion about porn, depending on our own hormone systems, our cultural conditioning, etc. This is quite a big subject but IMHO may have little to do with Ham Radio directly. In fact it is worthwhile hobbies, like Ham Radio, which can get our minds off porn in our spare time. Porn can become an obsession that can take up all of the spare time of some people, which is unfortunately not as reproductive as real marital sex...and can't be done well with devises that can be bought in Radio Shack either.

PCs can introduce us to porn...How about those Apples?...Maybe Eve gave Adam an Apple and he made her get dressed so she could tease him by being a stripper and getting undressed before there was any censorship or adult verification. Yep...That is probably how porn was born...because before that they didn't wear any cloths all of the time...so it wasn't usually a hard and fast big thing.

Some Hams like to be teased by the uncertainty of propagation conditions. Some Hams prefer the certainty of their own technical abilities. They want to be productive. Some folks want to be teased by porn. They may subconciously want to be reproductive but can't be without actually making real contacts. Some folks are just natural fruitful multipliers and propagate humanity so that it continues to survive.

Hello,
My son is working on a solar radio telescope project. He assembled(with a little help from dad!) the Jove receiver kit. Up and running as we speak. He is trying to measure "solar events" by observing day and then night and looking for differences.

Any comments that could help him out in his quest?

Thanks,
Bill

Nope. I have the Satellite experimenter's handbook and a copy of the microwave experimenter's handbook too, which had the information in it, scattered around a bit in different chapters. I was hoping that somebody had done a worksheet already. Oh well, it looks like I will be back at the computer finishing up the Mathcad worksheet I started. The calculations are not hard to do, I just did not want to spent some of my free evenings making up a worksheet if somebody else has already done one. There is no glory in reinventing the wheel as they say.

I'm using Mathcad 2K Pro to make the worksheet. If you don't have Mathcad, or the free Mathcad Explorer used to "run-only" existing worksheets, what I'm doing is not going to help you much. You can down load the Mathcad Explorer package from Mathsoft at

http://www.mathcad.com/mathcad/explorer/

The above is a HUGE down load, so I don't know if you would be able to get it, and or the cost to you in connect time charges. Mathcad is a much better software package for doing technical calculations, much better than a program such as Microsoft's Excel.

I dunno about that. By using low power transmitters you can simulate bad propagation conditions when there are good propagation conditions. This might improve your operating ability. Amateur Radio was never meant to be as predictable as commercial broadcasting. Heck...Whats a few dB down to most real Hams but a challenge? The Ham who becomes obsessed with QRP, like the obsessive porno watcher, may spend lots of entertaining time without making any real contact. To each his own!

Hams need more license classes ans/or technical endorsements.

I will.
>
> 73, Jeff KH6O

The history of the Q code stems from the Morse code era. The Q code is
in fact an international radiotelegraph code which was designed with
shipboard CW operation in mind. Hams took many, but not all, of the Q
signals as there own in the early days when most Hams were only using
CW.
Yep...Maybe there was no choice in the matter.

Ten - XX code is much newer. It was not only used by police in chase
movies but was designed for radiotelephone land mobile usage.
Many emergency services train operators to use ten-xx codes. Naturally
it found its way into CB lingo where it may be more applicable than Q
code.

QSL?

Now on the Internet there is no need for Q code or ten-xx code IMHO.
We can't send QRP e-mail unless we can use a weak provider. My typos

and misspelled words leave enough stuff for NG readers to decode, so why would I need any codes...except maybe to be considered an "in" Ham OM?

bye

Tongue-in-cheek, Bob. I was questioning "enfield's" comment above
where he writes: "An archaic QRP rig?"

>By using low power transmitters you can simulate
>bad propagation conditions when there are good propagation conditions.

I suggest you read Adrian Weiss' book, "History of QRP in the U.S.,
1924-1960" to see what our predecessors were able to accomplish
with low power. In those early years, there was no choice in the
matter.

73, Jeff KH6O

Dear Friend:

Do you need a change in your life?

Do you remember when the entire world seemed like it was
yours for the taking?

Do you remember a time when all of your hopes and dreams seemed
like they were attainable?

First of all, let's be honest. You are not going to earn $50,000 in
20 days. It just isn't going to happen. Anyone who tells you that
you can, is not being truthful. But, let me tell you about a plan
that can possibly make all your dreams come true...keep reading!

****

I would like to tell you about a plan that has changed my life.
Take a calculator and figure in the worst possible scenario. Decide
for yourself. If you decide that you want to take control of your
life and move forward...that is your decision.

****

Here's the step by step plan summary.

1)You order the 4 reports listed below ($5 each). They come to you
by email.

2)Save a copy of this entire letter and put your name at report #1.
Move all other names down. (You will be removing the person at the
level 4)

3)Use any of the hundreds of bulk email services out there.

4)Orders will come right to your door. Simply email them the report
they ordered.Isn't that about as easy as it gets???

****

Your cost to participate in this program is practically nothing
(surely you can afford $20 and initial bulk mailing cost). You
obviously already have a computer and an Internet connection and
e-mail is FREE!

The primary method of building your downline is bulk email.

Let's say that you decide to start small, just to see how it goes.
Let's assume that you and all those involved email out only 2,000

programs each. Let's also assume that the mailing receives a 0.5% response. The response could be much better. Also, many people will email out more than 2,000 programs. With a 0.5% response, that is only 10 orders for Report #1. Those 10 respond by sending out 2,000 programs each for a total of 20,000. Out of those 0.5%, 100 people respond and order 20,000. The 0.5% response rate to that is 1,000 orders for Report #3. Those 1,000 send out 2,000 each for a total of 2,000,000. The 0.5% response rate is 10,000 orders for report #4. That is 10,000 $5 bills for you. CASH!!!

****

Your total income in this example is: $50+ $500+ $5000+ $50,000 for a total of $55,550!!!

****

REMEMBER FRIEND. THIS IS ASSUMING 1,990 OUT OF THE 2,000 PEOPLE YOU MAIL TO WILL DO ABSOLUTELY NOTHING AND TRASH THIS PROGRAM!!! DARE TO THINK FOR A MOMENT WHAT WOULD HAPPEN IF EVERYONE, OR EVEN HALF MAILED OUT 100,000 INSTEAD OF 2,000. Believe, most people will do just that, and more!!!

Friend, you do the math. You look at the opportunity, if you decide that you would like to participate in this program, the decision is yours.

Recently, the Federal Trade Commission has tried to stop chain letters which promise you will make tons of money by participating. Such chain letters are NOT legal because of this reason. This new program complies with all the rules.

To be legal, a chain letter must offer a product and must not promise you will get rich by taking part. If you look at the program, do the math and decide that you will make money, it is your opinion. No such claim is here.

However, I do strongly encourage you to do the calculations. Figure out the worst possible response and see how it calculates.

Your orders come right to your door and you send your reports via email. You are not involved in personal selling.

You do it privately in your own home, store, or office. This is the EASIEST plan anywhere. It is simply order filling by email.

Order the four reports shown on the list below. You can't sell them if you don't order them!!!.

For each report, send $5.00 CASH, the NAME & NUMBER OF THE REPORT YOU ARE ORDERING, YOUR EMAIL ADDRESS, and YOUR NAME AND RETURN ADDRESS (in case there's a problem). MAKE SURE YOUR RETURN ADDRESS IS ON THE ENVELOPE IN CASE OF ANY MAIL PROBLEMS!

Report #1 will tell you how to download bulk email software and email addresses so you can send it out to thousands while you sleep. Remember that 50,000+ new people are joining the Internet every month.

By the way, there are over 50 million email addresses with millions more joining the Internet each year, so we don't worry about "saturation". People are used to seeing and hearing the same advertisements every day on radio/TV. How often have you received the same pizza flyers on your door. Then, one day you are hungry for pizza and immediately recall the flyer. Same thing with this letter. I received this letter many times- then one day I decided it was time to try it.

This program will not require you to come into contact with people or take any telephone calls. Just follow the instructions.

There is no guarantee either stated or implied that anyone participating in this program will earn $50,000+. (You must include that statement to make this legal.)

******* TIPS FOR SUCCESS *******

TREAT THIS AS YOUR BUSINESS! Be prompt, professional, and follow the directions accurately. -- Send for the four reports IMMEDIATELY so you will have them when the orders start coming in because: When you receive a $5 order, you MUST send out the requested product/report.

It is required for this to be a legal business and they need the reports to send out their letters (with your name on them!) -- ALWAYS PROVIDE SAME-DAY SERVICE ON THE ORDERS YOU RECEIVE. -- Be patient and persistent with this program.

****
Get started TODAY!! Notes- ALWAYS SEND $5 CASH (US CURRENCY) FOR EACH REPORT. CHECKS NOT ACCEPTED. make sure the cash is concealed by wrapping it in two sheets of paper. On one of those sheets write: (a) the number and name of the report you are ordering, (b) your e-mail address, and (c) your name and postal address.

2468. Palm Link Budget Program

Newsgroup: rec.radio.amateur.space
Date: 2000-10-18 00:00:00 UTC
From: Terry Berman <tsberman@mindspring.com>
Message-ID: <39EE3FB1.E1E5D692@mindspring.com>
Source record: 8202

I am an engineer and software developer. I have just completed a satellite link budget program that will run on any Palm device running PalmOS 3.5 and greater. I am looking for a few engineers in the industry who would be willing to Beta test it for me. In return you would receive the program once it goes into production plus free updates. The program can briefly:

- Calculate QPSK links for any data rate.
- FEC rates of 7/8, 1/2, 3/4
- Calculate G/T and AZ/EL
- Calculate Uplink, Downlink C/N
- Include UL, DL Interference
- Include Intermod
- Store locations and satellites

This program is based on a similar one that I have tweaked over many years of satellite consulting . I developed it because I hoped that there are many other engineers out there who needed to do these type of calculations for a customer and don't like hauling around their laptop everywhere.

During the testing period I would like to know:

1. Accuracy of the program
2. Usability of the program
3. Suggestions for enhancements
4. Any bugs found

If you would like to participate please contact me at:
tsberman@mindspring.com

Many thanks,

Terry, AB4UM

Experiencing Difficulty in Outer Space

7 tracks, total running time: 61:43

This long awaited release is finally available! Journey to the moon and back
on a homemade rocket ship. Heady ambience warmed by tape delay and punctuated
by casio-friendly feel-good tones for the modern misanthrope. Precisely edited
spontaneity, no overdubs.

As NOAA announced a week ago on their web site, NOAA-16's vhf transmitter has been turned off until mid-November to avoid a vhf clash with the operational satellite NOAA-14.

Bear in mind too that NOAA-16 is still undergoing on-orbit
checkout and testing. Its availability is not yet guaranteed.

I use a modified Pace analogue sat receiver to watch video transmissions from our local cop heli but for three days now on several occasions I have been receiving a color bar test card a little higher up the band. It lasts for about 12 mins and is strength P3. Anyone know what this could be .. I suspect it MAY be the new space station relay on test. ANY IDEAS PLEASE.

Hi

This is the first time I heard about "Project Jove".
Can you please tell me what is it and which resources are available on the Internet for the beginners ? My daughter is nearly 10 and I wonder if this may be of any interest for her ?
Thanks in advance,
Giovanni IT9XXS

It actually cleared up here in Seattle last night. I went out side at
the proper time and actually saw both of them pass over. Firt ISS,
then a minute later, the shuttle came right behind it!!
Very cool to see! :-)

I think I must have also seen an Iridium flash, I saw a VERY bright
satellite suddenly light up for about 8 seconds then go dim again.
Must have been as bright (or brighter) than Venus.

I have the H.F. module for the Yaesu FT-726R that is surplus to my needs. This module allows one to work the Russian satellites (RS-13/15) or the 15, 12 and 10 meter bands. Works perfectly! Supposed to be 10 watts but, in my rig, I measure a minimum of 10 and up to 15 watts output on the 10 meter band. This unit is rare as owners of FT-726Rs can attest: the module is not listed in the owners operating manual (but it was available!). Genuine Yaesu with cables and mounting hardware. Offers? ns1z@arrl.net

Im new to satellites and trying to help setup a club station for satellite operations. We have a yeasu 847 and a yeasu 5500 rotor control. Have tried both Nova for Windows and Logsat Pro for tracking and have them both tracking satellites ok. They purchased Logsat at the time much of the equipment was purchace a year or two ago. I rather prefer Nova but could get used to Logsat but I couldn't get the dos driver for the Kansas City Tracker to work right with the rotor. It just kept turning while I tried to do the install procedure. I got it working yesterday using the third party windows drivers I found at the logsat website but they have 2 drawbacks. They prevent Nova from working right, and they dont support the Yeasu-847, just the 736 (tried it anyways, didnt work).

Also, We had the distinct impression from the people who sold them the station that Logsat include radio control features. I cant find them either in the program or the docs. Am I missing somthing?

Are there any addons for Logsat or Nova that do radio control?

Is there a better program that does the whole thing that I should be looking at? Prefer Windows 98 softare.

Gio,
Project JOVE is a NASA sponsored project that provides 20.1 MHZ receiver kits
and dual dipole antenna kits for kids to assemble and observe Jupiter.

Go to http://radiojove.gsfc.nasa.gov

All the information you need is there!
Our kit is up and running as we speak.

Bill

Source record: 8226

TEXAS UNDER THE LEADERSHIP OF GOV. G. W. BUSH, IS RANKED:
50th in spending for teachers' salaries
49th in spending on the environment
48th in per-capita funding for public health
47th in delivery of social services
42nd in child support collections
41st in per-capita spending on public education
BUT
1st in air and water pollution
1st in percentage of poor working parents without insurance
1st in percentage of children without health insurance
1st in executions (avg. 1 every 2 weeks for Bush's 5 years)
5th in percentage of population living in poverty

HIS RUNNING MATE, DICK CHENEY, TOOK A STAND:
Against lowering oil (gas) prices
Against Head Start for children
Against the release of Nelson Mandela from prison
Against child protective gun locks and gun control
Against keeping the Department of Education
Against keeping the Department of the Arts
Against job training for veterans

Handgun Control Coalition: "Bush is responsible for a Texas law that makes it easy for citizens to carry guns into churches, synagogues, hospitals, nursing homes, and amusement parks."

Chicago Tribune, Steve Chapman: "Bush has a thinner resume than anyone elected president since Woodrow Wilson. How can someone with an undistinguished career in business and so little experience in government be adequately prepared for the most important job in the world?"

Frontline, PBS: "Bush applied to law school but could not get in."

New York Times, Paul Krugman: "Bush focuses like a laser on very well-off""

Washington Post: "Bush's tax cuts are dangerous."

New Republic, 10/9/00: "Texas overspent its budget by a whopping $610 million this year."

Sun-Sentinel, Jane Bryant Quinn, Washington Writers Group: "The public debt belongs to us all, just as the surplus does"the more we bring down the debt, the larger the stock of productive capital, and the higher future incomes will be."

Woman's Rights: Bush stated emphatically he intends to restrict a woman's right to choose. He once asked his wife, Laura, for her opinion about something and because it differed from his, he drove the Pontiac into the garage wall in a rage (George magazine, 9/00).

George Magazine, 9/00: Bush stopped drinking at 40 and began a "religious journey". He is not concerned about blurring the line between church and state. He created an unusual and aggressive Policy Committee on Religion. He and his staff wrote and passed legislation that allows churches to register as quasi-official government agencies. Sixty (60) churches have signed up so far and may start receiving government funding next year; but although they will be government funded, they cannot be inspected by the state. Bush calls these "faith-based laws." One "faith-based" facility was caught disciplining children by tying them to their beds. Bush's philosophy: "Discipline and love go hand-in-hand." By injecting religion into government, he has violated the First Amendment to the Constitution of the United States of America, which calls for a separation of government and religion. Bush says, people of all faiths are welcome---Muslims, Hindus, Buddhists, Catholics---as long as they believe in New Testament scripture and Christian doctrine.

Meanwhile, his brother, Gov. Jeb Bush of Florida, has meetings behind a locked wrought-iron fence"no reporters allowed"no minutes kept. Reporters have asked Jeb Bush to open the sessions. Bush has refused. This is a violation of the Florida State Constitution (Sunshine law). (Miami Herald 9/17/00)

Note: Hitler rose to power in a democracy and immediately began changing the law to make violating the German Constitution and discriminating against Jews and Christian non-aryans "legal." This eventually led to the death of millions of people of every religion, race, color, and creed. Ironically, Prescott Bush, director of Union Banking Corporation, who later became the Republican U.S. Senator from Connecticut, ran Nazi front organizations which financed and armed the Nazi war machine, building them up for the takeover of Germany, Europe, and the U.S.A., using slave labor. For his part in the Hitler revolution, Prescott Bush was paid a fortune. This is the fortune he left to his son, President George Bush. (see "George Bush: The Unauthorized Biography"Online," for well-documented details)

Bush lied during the 2nd Debate. The murderers of James Byrd did not all get the death penalty.

THINK WHAT THEY WOULD DO TO THE COUNTRY IF THEY WERE ELECTED!!!

Please forward this to every person of voting age you know

Source record: 8230

Im relatively new to radio astronomy and was wonder if this scanner would be suitable for radio astronomy. I've noticed it has no DC output so would I still be able to use it with a chart plotter or computer?
The following is the catalogue info on the scanner:

Uniden 9000XLT Desktop Scanner

Our fastest desktop scanner, the Uniden 9000XLT provides excellent performance and many new functions for ease of operation. It sports a large back-lit, 2-line LCD screen, speedy Twin Turbo operation (Scan at 100 channels/sec, Search at up to 300 steps/sec) and 500 memories (of which 250 can have alpha character names stored). Frequency coverage is 25MHz to 549.95MHz and 760MHz to 1300MHz, with 4 selectable step rates, 10 priority channels and AM, FM narrow and FM wide reception modes. Supplied complete with an AC adaptor and telescopic antenna. Other features include Auto memory sorting for faster scanning, Switchable attenuator to reduce overloading, Data skip and channel/ frequency lockout, Rotary tuning control, Scan/Search delay, Direct keypad frequency or memory entry. Includes jacks for line output and Aux. Control, and external speaker.

Features: Our best performance desktop scanner
Huge 25-549.95MHz and 760-1300MHz frequency coverage
Large backlit 2 line LCD screen for easy viewing
500 memory channels, 4 selectable step rates, 10 Priority channels
Twin Turbo operation finds activity faster (Search up to 300ch/sec)
Includes telescopic antenna and AC adaptor

Thanks in advance,

2498. FAST CASH

Newsgroup: rec.radio.amateur.space
Date: 2000-10-27 16:45:27 UTC
From: mcdonnellfam@home.COM
Message-ID: <39F9B152.720A6FE2@home.com>
Source record: 8232

Dear Friend:
With a couple of minutes of your time I'm
going to show you how you can
turn
$6 and
6 stamps into thousands of dollars. Don't
get skeptical yet, just read
the
letter and then decide if you want to invest
a measly $6!!

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND:
READING THIS COULD CHANGE YOUR LIFE! Wow!!
IT DOES WORK!

A little while back, I was browsing through
newsgroups, just like you
are
now, and came across an article similar to
this that said you could make

thousands of dollars within weeks with only
an initial investment of
$6.00!
So I thought, "Yeah right, this must be a
scam", but like most of us, I
was
curious, so I kept reading. Anyway, it said
that you send $1.00 to each
of
the 6 names and address stated in the
article. You then place your own
name
and address in the bottom of the list at #6,
and post the article in at
least 200 newsgroups.
(There are thousands) No catch, that was it.
So after thinking it over,
and
talking to a few people first, I thought
about trying it. I figured:
"What
have I got to lose except 6 stamps and
$6.00, right?" Then I invested
the

measly $6.00. Well GUESS WHAT!?...Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just

kept coming in. In my first week, I made about $25.00. By the end of the

second week I had made a total of over $1,000.00! In the third week I had over 10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly.
It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how

this works and most importantly, WHY it works... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy!
Six Bucks and Six stamps... not a big deal to get lots more $$$$. IT WORKS!!!!
Suggestion: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the money come in! It's easy.
It's legal. And, your investment is only $6.00 (Plus postage).

IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk - it really works! If all of the following

instructions
are adhered to, you will receive
extraordinary dividends.

PLEASE NOTE:
Please follow these directions EXACTLY, and
$50,000 or more can be yours
in
20
to 60 days. This program remains successful
because of the honesty and
integrity of the participants. Please
continue its success by carefully
adhering to the instructions.
You will now become part of the Mail Order
business. In this business
your
product is not solid and tangible, it's a
service. You are in the
business
of developing Mailing Lists. Many large
corporations are happy to pay
big
bucks for quality lists. However, the money
made from the mailing lists
is
made from people like you and me asking to
be included in that list.

Here are the 4 EASY, EASY, EASY steps to
success:

STEP 1: Get 6 separate pieces of paper and
write the following on each
piece
of paper "PLEASE PUT ME ON YOUR MAILING
LIST."
Now get 6 US $1.00 bills and place ONE
inside EACH of the 6 pieces of
paper
so the
bill will not be seen through the envelope
(to prevent thievery).

Next, place one paper in each of the 6
envelopes and seal them. You
should
now have 6 sealed envelopes, each with a
piece of paper stating the
above
phrase, your name and address, and a $1.00

bill. What you are doing is
creating a service. THIS IS ABSOLUTELY
LEGAL! You are requesting a
legitimate service and you are paying for
it! Like most of us I was a
little
skeptical and a little worried about the
legal aspects of it all. So I
checked it out with the U.S. Post Office
(1-800-725-2161) and they
confirmed
that it is indeed legal. Mail the 6
envelopes to the following
addresses:

1) Sue Wagner
608 First Avenue
Altoona, PA 16602

2) C. Mangan
503 Oak Ave NW
Elkader, IA 52043

3) Richard Powers
748 Battlefield Blvd. South
Chesapeake, Va. 23322

4) Ryan Palmer
6595 380th Ct.
North Branch, Mn 55056

5)Susan Moreland
233 cr 190
Longbranch, TX 75669

6)Carrie McDonnell
3130-109 Ave S.W.
Calgary, AB Canada
T2W 3H2

STEP 2: Now, you do not need to re-type this
entire letter . Simply put
your
cursor at the beginning of this letter and
drag your cursor to the
bottom of
this document, and select 'copy' from the
edit menu(or right mouse click
and
choose "copy"). This will copy the entire
letter into the computer's
memory

temporarily. Now click "Start" then
"accessories" then "wordpad" Open a

blank 'notepad' file and place your cursor
at the top of the blank page.

>From the 'edit' menu select 'paste'.(or
right mouse click and choose
"paste") This will paste a copy of the
letter into notepad so that you
can
add your name to the list. Take the #1 name
off the list that you see
above,(to do so, put your cursor at the end
of the address of the FIRST
(#1)
address and click "backspace" until name and
address are gone.) Change
the
other numbers to one lower number (6
becomes 5, 5 becomes 4, etc...) by

putting your cursor on the right side of
each number and pushing
backspace
one time, then type the new number and add
YOUR Name as number 6 on the
list. (when you add your name it may be
double spaced... thats ok.)

STEP 3:. Now, post your amended article to
at least 200 newsgroups (I
think
there are close to 24,000 groups). All you
need is 200,
but remember, the more you post, the more
money you make! You won't get
very
much unless you post like crazy. :) This is
perfectly legal! If you have
any
doubts, refer to Title 18 Sec. 1302 & 1341
of the Postal lottery laws.
Keep
a copy of these steps for yourself and,
whenever you need money, you can

use it again, and again.

PLEASE REMEMBER that this program remains
successful because of the
honesty

and integrity of the participants and by
their carefully adhering to the

directions. Look at it this way. If you are
of integrity, the program
will
continue and the money that so many others
have received will come your
way.

NOTE:
Iit might be a good idea to wrap the $1 bill
in dark paper to reduce the

risk of mail theft.) As each post is
downloaded and the directions
carefully
followed, six members will be
reimbursed for their participation as a List
Developer with one dollar
each.
Your name will move up the list so that when
your name reaches the #1
position you will be receiving thousands of

You could build a Dicke radiometer. Quickly switch the receiver input
between the antenna and a reference noise source (e.g. a resistor).
The switching rate could bee a few hundred Hertz. Use a synchronous
detector at the audio output to generate a DC signal that is
proportional to the difference between the antenna signal and the
reference signal.

>can have alpha character names stored). Frequency coverage is 25MHz to
>549.95MHz and 760MHz to 1300MHz, with 4 selectable step rates, 10 priority
>channels and AM, FM narrow and FM wide reception modes. Supplied complete

FM is useless, since it goes into limiting. AM might be usable, but
SSB would be preferable.

The frequency range is not very usable, I think the Jupiter noise is
around 20 MHz and e.g. the 21 cm hydrogen line is also outside the
frequency band.

2500. RS13/15 Rise Times

Hello All:

Considering getting into ham sats but first want monitor the 10m RS satellites.

Where can I find a list of the rise times and max el for the RS13 & RS15 based on Washington D.C. (my qth is 50 miles sw in VA).

Thank you,

de Richard/N2JR

There are alot of amateur astonomers who scan the sky at around 400-410, 600,
8-900MHz,
A couple of good sites:

http://www.nitehawk.com/rasmit/
http://members.aol.com/gca7sky/lambda.htm

The problem for me is to find acceptable antennas, both by the neighbours and me
:)
Stacked yagi's are spacious, and I'm yet to find a big parabolic dish within
reasonable
distance from my house...

The LNA is a low noise amplifier (read as preamp). The LNB is a low noise block converter. It will take a Microwave signal (10 ghz or 3 ghz) and convert it to a lower frequency (about 950 to 1400 mhz, or mabe 70 mhz for example).

Go to the amsat.org web site for ham sat news. Then go to their files section and download one of the tracking probrams. Also download their Kepliarin element set. This is a bunch of numbers that tell the tracking program how to calculate the position of each sat. Run prorgam with the current set of elements.

Hi Richard
You can try www.heavens-above.com
it gives passes that are above 10 deg.
You can download Winorbit at http://www.sat-net.com/winorbit/
and calculate your own tables.

I was looking through the description of the P3D digital design, and they mentioned an article...

[1] The DDC has been mentioned previously in QEX, see Anderson, P. T.,
"A Simple SSB Receiver Using a Digital Down Converter", QEX, March 1994, for an overview

Which I'm very curious about. Err, that is exactly how they did it. I see a bunch of zip files on the arrl web site such as 'A simple synchronous-AM detector for the DDC-based receiver' and I wonder if this is it. Or, at least it seems somewhat encouraging that maybe there's a DDC+DSP design that amateurs have gotten to work.

Optimistically I'm hoping someone designed a circuit board that I can plug in and go -- but I'm also interested just for ideas on what they did and the problems they ran into. I think having an exact copy of the P3D digital board would be nifty for maybe trying to code that would work with that. But mainly I'm looking to learn about this stuff.

At least could someone fax me a copy of the article to 510-649-0452, or maybe email me PDF/text files if they have those?

Hi,

It should be pointing north, if you're in the southern hemisphere, and able to swing up from close to your northern horizon through the zenith (i.e. straight up - sorry if that was patronising:-)) and back down to the south celestial pole (SCP). The SCP is located at an angle equal to your latitude above your southern horizon. Idealy, don't use magnetic north/south, but check your magnetic deviation - it's on good maps.

That was surprisingly b!**dy hard to write! Everything's got to be back to front from what it is up here in the UK.

I'm curious, so now for my questions; what are you building? What design, diameter, frequency/bandwidth, front end electronics and spectrometer are you using, etc., etc.? What's your spectral coverage, antenna temperature or flux density limit etc.? How are you going to analyse data?

Ed.

The optimum direction for SETI is probably straight up++, as that gives
minimum atmospheric noise. If you are limited to a 90 degree arc from
horizon to vertical in one direction, South might be best as that will
cover a blind area for many radio telescopes. On the other hand,
you want to have someone who can confirm any detection.

If you are not constrained to the horizon, 45 degrees either side of
vertical might be better.

For astronomy, I suspect North is best, because it gives access to the
Sun and Jupiter, and, I think, more of our galaxy (I'm assuming that
interesting SETI sources would be local enough not to be concentrated in
the plane of the galaxy).

You should certainly investigate the <http://www.setileague.org/>
site, and should probably join their public mailing list. Their
eastern Australia cordinator== (unfortunately Brisbane, not Sydney)
frequents both that list and the closed list, although the closed list
would be better for this question. Asking on the public list may just
result in advice to join the league, to get access to the closed one.

You should definitely have a look at:

<http://www.setileague.org/hardware/rotors.htm>
SETI: What About Antenna Rotors?

++ Without a polar mount and drive, more polar directions allow longer
integration times, but more equatorial directions cover more solid
angle.

== Blind copied to him.

First of all let me say im 14 so you may see me post a couple of really dumb questions and what I'm about to say may be completely wrong and make little sense so this whole thing is gonna be a learning experience for me with help from my dad who knows a bit about radio and help from one of my friends at school who knows a bit about physics and my school teachers.

Im mainly going to be focusing on SETI for starters, because it is less costly than radio astronomy, and will move on to radio astronomy when my parents bank account has recovered.

My setup will basically include a 3m C-band dish from Sky Channel, I was looking a 4.5m but have no where to put it. Im buying a 1.42 GHz wave guide feed horn from Radio Astronomy Supplies and a 1.3-1.7 GHz LNA from Down East Microwave. My reciever will probably be a AR5000 from AOR, if I can convince my parents to buy it.

Quick question, is it absolutely necessary that my dish point from the northern horizon to the SCP if its fixed in zenith? Unfortunately I think it is.

I just read my last post and realised the question at the end doesn't make much sense, and i found out the answer anyway.

2524. Amateur Radio operations on ISS expected to commence in November.

Newsgroup: rec.radio.amateur.space
Date: 2000-10-29 02:59:03 UTC
From: Will Marchant <kc6rol@amsat.org>
Message-ID: <39FB9285.D2DB5108@amsat.org>
Source record: 8106

Launch of the first ISS crew, Expedition One, is set for the morning of October 31st, on a
Soyuz rocket from the Baikonur Cosmodrome. William Shepherd, KD5GSL, is the expedition commander. Yuri Gidzenko is the Soyuz vehicle
commander. Sergei Krikalev, U5MIR, is the flight engineer. NASA Television plans
extensive coverage, beginning at 0200 EST on that date.

The flight to the ISS will take approximately two days, with a docking expected on November 2nd. The crew has expressed a high level of interest in
beginning amateur radio operations early in their mission but it may be several weeks
before they can setup the amateur radio station and begin operations (probably no earlier than
November 14).

The crew may be using their own callsigns (KD5GSL, U5MIR) or they may be using one of the club stations allocated to the ISS: DL0ISS, NA1SS, or RZ3DZR.

The Expedition One crew's activities are being scheduled around the UTC timeframe. It is expected that their working day will start around 0800 UTC and end near 1900 UTC. There may be a lunch break near 1200 UTC. Passes near the beginning, lunchtime, and end of the crew day might be good times to find a crewmember relaxing with amateur radio activities. The crew also has a "weekend" off from 1200 UTC on Saturday until the end of the day on Sunday. This might be another good time to listen for crewmembers using the amateur radio equipment. Please remember that the crew is using ham radio to relax from a very difficult job. They may, or may not, be interested in working a pile-up. They might be more interested in "rag chewing" with one or two hams on a given pass. Please respect each crewmembers different operating style.

It is not known yet how much power on board the ISS will be available for leaving the packet rig powered during times when the crew cannot perform voice contacts. We continue to request that the packet rig be left on as much as possible. The crew has been trained in the use of the beaconing capabilities, and we hope that they will use that to share their experiences as the first permanent crew on the ISS. This is a "standard" AFSK AX.25 "terrestrial packet" rig, so it can be used for APRS and email can be sent to the crew. Please do not use the system to leave email for other hams on the ground. Use the mailbox to leave email for the crew.

Initial operations will only take place on the 2m band. The tentative frequencies are:
Worldwide downlink for voice and packet: 145.80
Worldwide packet uplink: 145.99
Region 1 voice uplink: 145.20
Region 2 & 3 voice uplink: 144.49

Please remember to practice good operating practices and remain courteous and patient with this crew while they establish their ham operations preferences. Listen before transmitting, to make sure you don't step upon another QSO. Wait for the crew to call for contacts before transmitting. Please let others have a chance with a rare contact, don't monopolize the crew or the packet rig. Please do not ask the crew to schedule school contacts or other schedules: this puts them in an awkward and uncomfortable position. Information about requesting dedicated contacts will be available on the ARISS web pages (http://ariss.gsfc.nasa.gov/) shortly.

QSLs and SWLs will be accepted and can be processed through Radio Amateurs of Canada or the American Radio Relay League. The card design is being finalized, but should be ready for distribution early next year. Details can be found on the ARISS web page.

The planning for school operations is actively underway, and efforts are being made to have the first several school contacts before the end of the year. It is hoped that several school contacts can be accommodated each month, but the crew will be exceedingly busy and everyone must be prepared to support more, or possibly, fewer school contacts. The initial schools have been contacted and efforts are underway to finalize the details of their contacts. The ARISS organization is beginning to accept applications for school contacts; however, the crew workload will determine the amount of time that passes between accepting an application and when a contact is scheduled. We must all remember that these are very early times for the ISS and we need to remain flexible in pursuing amateur radio operations with the crews.

Please stay tuned to the ARISS web pages (http://ariss.gsfc.nasa.gov/) for the latest information about frequencies and other operational issues.

Not much, the amateur satellite allocation is currently uplink only.

In addition to satellite navigation service, there are active remote sensing allocations in that region. I once tried to detect the ERTS satellite radar without success.

> Can someone please give me a formula for calculating my satellite dish's
> beam patter in degrees.

To calculate it accurately you need to define what constitutes the
edge of the beam and you need to know the variation in sensitivity
across the area of the dish (SETI dishes should have low sensitivity
at the edges, so that the sensitivity for the overspill of the feed
pattern onto the hot surrounding ground is low).

For a rough approximation, construct a right angled triangle with
the hypotenuse as the diameter of the dish, and the shorter side one
wavelength. Twice the the smallest angle in this triangle (arcsine
of the wavelength over the diameter) gives you the angle outside which
the edge of the dish is completely cancelling the signal at the centre.

For another approach, take the gain formula from the SETI groups' FAQ and
divide the solid angle covered by a sphere (4 pi) by the gain, to get the
solid angle covered by an even sensitivity beam that had the same gain.
If I've got the units right, for small beamwidths, the angular radius of
that circle in radians should be the half beamwidth and should be sqrt
(2 / gain) radians. This will underestimate the realistic beamwidth.
(NB the gain should be based on 50% efficiency, for a correctly configured
SETI dish. You should use the linear gain, i.e. 10^((dB gain) / 10).)

If you have Excel, there are a number of the spreadsheets at
<http://www.setileague.org/software/spreadsh.htm> which compute
beamwidth estimates under various assumptions. There is a
BASIC program that computes beamwidth, and other things, at
<http://www.setileague.org/software/aburto.htm>.

Hiya,

Bookvous <bookvous@optushome.com.au> wrote in message
news:eLHK5.3826$KY1.10317@news1.rivrw1.nsw.optushome.com.au...
> First of all let me say im 14 so you may see me post a couple of really
dumb
<snip>

Don't worry - I was pratting about with old valve receivers and bending bits of car roof racks for astro' antennae when I was 14 - and that was only 11 years ago! It never definitely worked 'cos I didn't spend more than a few quid on it, but I know a little more theory now! Good luck with yours. And I'm sorry if what follows gets too technical- Ive tried to explain myself!

<snip>
> Im mainly going to be focusing on SETI for starters, because it is less
> costly than radio astronomy,

If you work at high HF (i.e. 28 MHz or so) or VHF, basic radio astro' is easy enough; sounds like you're willing to spend a lot more money than I ever did, so 1.4GHz should work. Microwave gives nice narrow beam patterns without building a thing tens of meters across.

You could also try listening for signals from Jupiter's interaction with the plasma from it's moon, Io, using an HF comm's receiver (am or ssb) and a dipole at a quiet frequency between 20 and 30 MHz - see http://www.astro.ufl.edu/radioobs.html and links. With the modifications in the next paragraph you should be able to detect solar flares and the centre of our Galaxy if you put a low noise preamp, and /or big antenna, on it.

At 21cm -or any other frequency- try integrating the signal level (just needs a series resistor and a parallel capacitor) for, say, 10 sec or 1min (integration time, t= R*C) and look for the Milky Way when it goes through the beam. Or integrate with software if you're using a data logger on a PC. Signal/Noise improves as the square root of t. You may be better off to rectify the IF, and integrate it with analogue circuitry - don't use normal am/fm/ssb demodulation. Then run it through a DC amp' and log the voltage - shielding out mains hum can be a pain at this stage. Oh yeah - and make sure the AGC is off, or your data will be meaningless.

I've never thought much about SETI as an amateur project, but I suspect it's harder than basic astro. Bear in mind that S@H uses a 1000-foot antenna!
SETI is looking for V. weak signals too,probably weaker than many astrophysical emmisions, but essentialy there are two kinds of evidence -

positive and negative. Disproof is as usefull as proof since it constrains what we think may be within the bounds of possibility, but (without bothering to do any calculations) I doubt you'll find ET! But who knows, I doubt S@H will find them either, but I'm still doing it - only started a couple of weeks ago infact. It'd be a v. weird coincidence if we didn't hear from them sooner or later, so someone's going to have to answer the phone :^)

If you want to try amateur SETI, figure out where one or more close sun-like stars are and aim for them - easy if you've got a planetarium program on your PC. Epsilon Eridani (south west of Orion at about RA=3h33 Dec= -09:33deg) is one obvious choice for a southern hemisphere observer. If I were you I'd look round the net for the latest ideas on good posibilities of big planets round sun like stars, cos ther might be some earths there too - shame you can't see Tau Ceti down under. Point your antenna north, at the appropriate elevation and wait for it to go through the beam once a day (every 23h56min actualy). Then you'll have less data to crunch and you can run for an hour or less per day and tell your parents you're saving on the electricity bill!

>and will move on to radio astronomy when my
> parents bank account has recovered.
>
> My setup will basically include a 3m C-band dish from Sky Channel, I was
> looking a 4.5m but have no where to put it. Im buying a 1.42 GHz wave guide
> feed horn from Radio Astronomy Supplies and a 1.3-1.7 GHz LNA from Down East

Compare the S/N gain and stability of your LNA (and the rest of the system) with that used by the guys at the URL below. If they are a lot worse, save up for a better one.

There are "tricks" to get rid of noise and gain drift in amp's and recievers. You could do a web search for "Dicke switched radiometer" or "cold reference radiometer" or for "phase switched interferometer", but I should think they're easier with wire than with waveguides. Also, let every thing warm up before using it and try to stabilise at a resonably low temperature. You might even try cooling your pre-amp somehow, but that's a bit fancy. Also, as I said before - integrate your output. people usualy build a little box with a multiway switch and different capacitors for different integration times.

> Microwave. My reciever will probably be a AR5000 from AOR, if I can convince
> my parents to buy it.
>
> Quick question, is it absolutely necessary that my dish point from the
> northern horizon to the SCP if its fixed in zenith? Unfortunately I think it
> is.

Sorry - I thought you meant it could go up/down ("altitude" or "elevation") but fixed in azimuth(east/west). If you point it at the zenith, or any fixed elevation, it's very limiting. At Areciebo they move the feed horn to give some "steerability" to the beam on the 1000foot dish. That also makes the beam pattern change (into an ellipse from a circle), if you're looking away from the zenith.

You asked in another post about beam width - generaly defined as the angle within which signal from a point source (i.e. anythingthing small in angular size compared to the beam) excedes half the power at beam centre. This is called full width half maximum (fwhm) beamwidth or half power beamwidth (hpbw); see the radio astro' tutorials about antennae at the URL below.

I s'pose if you've got a fixed dish and moving feed, the beamwidth in the declination (I'll call that "hpbwd"; dec' is "latitude" in the sky, equivalent to elevation of the antenna minus your terrestrial latitude) axis must be hpbwd = fpbw/cos (theta), where theta is angle that you've moved the beam off-centre (which is equal to the angle you move the horn off center in the other direction).

Altitude control isn't essential, but if I were doing what you are, I'd risk the extra woodwork/metalwork and make it variable in elevation, if you want to do radio astro' - what's known as a transit instrument, 'cos it sees things transiting your celestial meridian. you don't have to go all the way from horison to SCP if it's too difficult. But diameter is vital, and easier/ cheaper for a zenith instrument.

Also, check out this URL (it's the one I refered to a couple of times above); http://fourier.haystack.mit.edu/SRT/index.html - lots of usefull stuff. It should tell you almost anything you need to know, but there's more than one way to build any system, so read the theory and make up your own design. There's a lot of other stuff on the web about projects people are doing and radio and astro' theory.

Hope that helps - I'll keep an eye on this post for anymore questions.

Seeya, Ed.

yes, but if your antenna dosn't see any very nearby sunlike stars at the
zenith you may as well not bother unless you have V. sensitive gear.

For a pretty complete tutorial check out

http://www.aticourses.com/antennas_tutorial.htm

or for a basic set of "pocket calculator" rules of thumb. . . . .

http://ewhdbks.mugu.navy.mil/ANTENNAS.HTM

where you'll find that the 1/2 power beamwidth of a parabolic antenna
is roughly equal to

BW = 70 * wavelength / diameter

For 144 mhz (2 meter) and a 10 meter dish, 140/10 or 14 degrees (ps
thats a pretty sloppy antenna pattern compared to Arecibo isnt it!).
At the end of the page there is even a nice nomograph for pairing up
aperture,

Regards
bk

You know, that might be an interesting exercise! If we ploted stellar
distances vs declination for all of the stars with known distances it
might just indicate a "declination of choice" for the homebrew dish and
maybe a "declination of interest" on the S@H gaussian and coverage
plots! Not the most systematic approach to the random problem, but
"random distribution" does not exactly preclude some "grouping" of the
data!

Probably the middle of next year. That is the next time we have any
space available for things going "uphill." While not a lot of stuff
(software for one of the laptops and a cable to go from the laptop to
the ham radio rig) it does need extensive qualification and it does take
up room in the manifest.

Thanks for all your replies to my posts.
I have a few more questions:
When im talking in terms of recievers what is integration?
What is the difference between a normal reciever and a total power reciever?
I think a total power reciever produces a DC current proportional to antenna
temperature, and is therefore more suited to radio astronomy, and a normal
reciever produces an audio signal, which can then be processed and is
therefore more suited to SETI.
Im at a lattitude of 33°5' S, so if I have worked this out right to see the
SCP I need to be aiming about 34° about the southern horizon and therefore,
to have a full view of the southern sky, I need to be able to see about 56°
above the northern horizon. Right?

At the moment im still after a dish, and I spent about an hour on hold when
I called Sky Channel to find out about the second-hand dishes they say they
are getting rid of. Eventually I gave up and decided it might be a good idea
to study for my science yearly exam tomorrow.

Thanks in advance,

Hi Richard,

> Where can I find a list of the rise times and max el for the RS13 &
> RS15 based on Washington D.C. (my qth is 50 miles sw in VA).

There is a web page which provides custom satellite information for
any location you choose. This includes the amateur radio satellites.
It may be a good place to start until your get your own tracking
program installed and running.

Go to http://www.heavens-above.com

Select the link to choose your location from this opening page.
After you have chosen your location, heavens-above will generate
a customized web page. Bookmark this second page. There is a
link on the page which will give you daily predictions of amateur
radio satellites.

Hope this helps,

>not from a probe passing near our galaxy?

It had better be a very powerful probe with a huge antenna if that's the case. Figure the path loss for any extra-galactic signal and you'll see why. It is more probable that very high power transmitters and very large gain antennas will be in the home system of ET rather than be cruising through extra-galactic space.

Most amateur systems will have great difficulty picking up probe signals originating inside our *solar system*. Picking up ET's signals from distant solar systems in our galaxy is orders of magnitude harder, and picking up ET's signals from *outside* our galaxy much tougher yet. The inverse square law won't be denied, and the already huge scale of our solar system quickly gets dwarfed when considering interstellar distances, much less the enormously larger extra-galactic distances.

You have to postulate truly enormous ERP on the part of ET to have any possibility of receiving signals from outside our solar system. That's a major engineering challenge for anyone, and unnecessary for any ordinary purpose. Perhaps that's why we haven't heard anything.

I'd suggest that anyone seriously thinking about searching for ET signals should first concentrate on receiving the signals in our own backyard. If you can't hear Mars Observer, Galileo at Jupiter, or Voyager and Pioneer near the edge of the heliopause, you probably can't hear anything likely to be in operation outside of our solar system either.

But that is the main problem for SETI as well, and (IMHO) the reason they
won't hear anything. When considering reasonable EIRP levels (say, a
couple of megawatts), the detection range is very, very short when compared
to interstellar distances, let alone intergalactic distances.

So, while there may be many other stars with planets, only very few of them
will be within range. The chance that a lifeform exists on one of them is
small, even when millions of other civilizations exist in the universe.
And the chance that a lifeform exists that routinely transmits megawatts
of power in our direction is neglible.

But, as Mr. Spock always says, "There are always possibilities".

If ET wanted to dedicate a 30 meter dish and a 1 MW transmitter
to each of the nearest 1000 eligible star systems, you would
have a lot more than 1 GW erp on each continuously.
Presumably, this wouldn't be hard for an advanced ET carrying
out a planet-wide effort. A HECK of a lot cheaper than the
Apollo project, which was done by one country in the 1960s.

Our sun would probably be on the list of anybody anywhere near
here, especially if they had already detected Jupiter (or even
Earth) by astronomical methods and noted the circularity of the
orbits.

We really don't know. Galileo used his telescope to observe
Jupiter almost as soon as he could get his hands on one. S@H is
the same kind of thing. Don't theorize whether there should be
aliens, go out and look for them, even if your tools are less
than you would like.

The consequences of success are so tremendous that a the project
is still a good idea even if the chance of failure is in the
99.9% range, IMHO. Especially since the only alternative at the
moment is to sit around watching SF movies.

Hiya,

Disclaimer; Before I start, let me point out that my background is in astro' and physics, not comunications. I may be able to understand the theory and explain some of your options, but i'm no expert on specific equipment, so don't go spending money on my say-so alone! I might be able to find you definitive answers, but I'd take many hours poring through old textbooks and wearing out my calculator battery. OK, I've said my piece, so:

Possibly it would work, but with any receiver you'll have to tap off the final IF output and rectify and amplify it without using blocking capacitors - i.e.no audio circuits. That involves taking a soldering iron to an expensive piece of kit. I'd be happier doing that in a stand alone device, not connected to a PC.

CW audio output run into your PC's sound card might do the job at a pinch but I wouldn't recomend it. Realy what you need is an unambiguous indication of the radio power reaching your feed, and that means measuring the voltage at the IF.Also it's imperative that the AGC can be disabled .

Alternatively it's possible to disconnect the feedback wire of the AGC physicaly, and use that voltage, 'cos that basicly is rectified IF that's been integrated. Then you leave AGC switched on, but you've disconnected it from the amplifier it controls. Either of the above methods is far easier in a big clunky hardwired thing than a minaturised device, so best try to get a circuit diagram from the manufacturer and see what is possible, cos you can't unsolder conections inside a chip!

Another alternative is that a hacker might be able to crack and use use the software supplied with it to get a power indication from the signal meter circuit, if your preamp was fantasticly high gain. I don't entirely trust that idea though

As I suggested in a reply to your previous post SETI basicly involves building a radio telescope, that is unless ET has a *huge* amount of transmitter power available and his signals are still on their way. A high gain, low noise amp and big dish are the things you should realy spend money on. If they're good enough then receiver sensitivity is comparitively secondary in importance. and if you use a cold reference type system, you can null out gain drifts, and improve sigan to noise ratio.

Being boring for a minute, it sounds a fun project, but to maximise mankind's (already slim) chances of catching a real live Little Green Critter in our lifetimes you might still be more realistic buying a faster processor(s) to run S@H!

There's a few point for you to think about, but you realy need someone who knows less astronomy and more comunications/RF engineering. And I'd recomend reading up quite a bit on radio technology/ radio astro before spending much cash. Good top end UHF /microwave stuff 'aint cheap; radio astronomy is easier (I wouldn't say you can use junk, but...) and cheaper than the most basic 21cm SETI if you go to, say, about 2m or longer wavelength. Remember second hand gear, even if a bit dated, may give much higher quality for the price.

Ed.

Not really. The products from this company seem to be oriented toward eavesdropping on cellular phone conversations, capturing cell phone id's and codes, cracking frequency hopping communication, etc. More a police, military, or intelligence service type of equipment than SETI equipment. In addition, it is not nearly sensitive enough for SETI work, and is possibly illegal in many countries.

What you need is a directional dish (greater gain and less noise,) a low noise amplifier and block down converter built into the antenna, and a receiver that works in the narrow range around the waterhole frequency, say 1.4 GHz to 1.44 GHz. Then you need to record the reception or process real-time with a computer. There a PCI cards available for a PC (in the $200 US range) that act as a spectrum analyzer. The dish is probably the most important piece of equipment; for the 1.4 GHz area, size is everything. The wavelength at 1.4 GHz is about 20 cm, so the accuracy of the curve of the dish need be only about +/- 3 cm. The larger the diameter, the greater the antenna gain, and the greater the directionality. A five meter dish would give a half power beam width of about 1 degree at 1.41 GHz. It would also be very heavy, especially if it were steerable. A 2.5 meter dish would have twice the beam width and 1/4 the gain; but it would be much more manageable. There should be lots of this size around as surplus, especially as the high power MPEG 2 TV transponders in geosync orbit replace the earlier, lower power transponders. Now you just need the stuff in between. I've seen a website that advertises LNA's, LNB's, and receivers for SETI.

By the way, the 5.5 m steerable dish I operated for ten years cost about $115,000 US and required three-phase 480 volts AC to operate the positioning motors. And keep in mind that, unlike most antennae, the LOWEST position for the dish is best; hills give protection from noise of terrestrial origin. Even if you lose access to some of the sky, there is still enough left to last you a lifetime.

> faster processor(s) to run S@H!

Perhaps when S@H expands it's scope (so to speak!) then I'd agree. But at the moment, S@H has more processing capacity than it needs, even with the improved v3 client. There's an interesting article that suggests a combination of S@H-like distribution and amateur dishes:
http://www.setileague.org/articles/galactic.htm

Quote from article:
"SETI@home has some impressive strengths, offset by one significant weakness. Its nearly two million home computers are crunching data from a single source, an antenna which in turn sees only a tiny fraction of the sky at any time. To avoid missing the call, we really need about a million such radio telescopes, coordinated so as to point in all directions at once. But at a cost of perhaps a hundred million dollars apiece, we've just exceeded the Gross Planetary Product. Fortunately, there is another way..."

> Good top end UHF /microwave stuff 'aint cheap; radio astronomy is
> easier (I wouldn't say you can use junk, but...) and cheaper than the
> most basic 21cm SETI if you go to, say, about 2m or longer wavelength.
> Remember second hand gear, even if a bit dated, may give much higher
> quality for the price.

Yep, a receiver suitable for SETI is generally more expensive as it needs to have excellent frequency stability. Having even the slightest frequency drift would make a nonsense of narrow-band FFTs when analyzing via a PC.

Most SETI amateurs swear by the iCom R7000 receiver or similar in the range. There's plenty of them knocking about on the second-hand market, lots of support from others and some good software written specifically for it, e.g. SETI Fox.

> needs a series resistor and a parallel capacitor) for, say, 10 sec or 1min

For SETI, you integrate the individual channels after the FFT, not the raw signal. (S@H doesn't bother to integrate because the transit time is about the same as the reciprocal of the minimum bandwidth, which is approximately the minimum usable bandwidth for interstellar signals.) Most amateur systems do integrate because their minimum bandwidth is larger and so is their transit time.

> SETI is looking for V. weak signals too,probably weaker than many
> astrophysical emmisions, but essentialy there are two kinds of evidence -

S@H is looking for signals that are much stronger than natural sources in terms of power spectral density. The extremely narrow bandwidth means the total power is still much less than broadband natural emissions. S@H isn't interested in signals that are less than 22 times the mean noise in the minimum bandwidth, but a lot of natural sources would be significantly below the noise floor (the microwave background is 11 or 12 dB below, and, I think, most hydrogen line emissions are well below).

> If you want to try amateur SETI, figure out where one or more close sun-like
> stars are and aim for them - easy if you've got a planetarium program on

Amateur SETI isn't really suited for targetted work. He doesn't have a polar mount and certainly doesn't have a suitable drive, combined with the fact that the beamwidth is relatively large, for a 3m dish, he's certainly going to cover several stars that would be on the project Phoenix short list if Arecibo could point in the direction, whichever elevation he uses. Project Phoenix can completely outperform him for any targetted search.

Current amateur SETI is all drift scan and the objective is to cover as much sky as possible as often as possible to maximise the chance of detecting a short duration signal.

Targetting a few obvious stars would mean he'd have to be extremely lucky to get one that is inhabited, even if ETIs are fairly common. He'd also probably be targetting exactly the same stars as everyone applying that philosophy.

> Compare the S/N gain and stability of your LNA (and the rest of the system)
> with that used by the guys at the URL below. If they are a lot worse, save
> up for a better one.

S/N is important, and the ones he is using are typical amateur SETI ones, so should be good. Gain and noise stability are not particularly important for SETI as you use the adjacent channel noise as a reference. Obviously instabilities that cause significant increases in noise are undesirable. Note that even sky noise doesn't matter when you use adjacent channels for reference and are looking for narrow band signals (it will affect the minimum detectable signal, but even below the noise signals will be distinguishable without knowing the absolute noise level).

Receiver frequency stability is important and amateur SETI tyically uses 10Hz bins because of this.

> There are "tricks" to get rid of noise and gain drift in amp's and
> recievers. You could do a web search for "Dicke switched radiometer" or
> "cold reference radiometer" or for "phase switched interferometer", but I

As noted above, you use the adjacent channels as your reference (this is, I think, what baseline smoothing is about in S@H).

> some "steerability" to the beam on the 1000foot dish. That also makes the
> beam pattern change (into an ellipse from a circle), if you're looking away
> from the zenith.

The Arecibo dish is spherical, so the spherical aberration is constant. However it is possible that some of the feed spills over the edge of the dish (undesirable from a noise point of view) changing the pattern at extreme angles.

> I s'pose if you've got a fixed dish and moving feed, the beamwidth in the

I didn't read the question as saying the dish was fixed, but if it is, the project Argus documentation (URL already given) advises choosing a direction and staying with it. The long term aim of project Argus is to have enough stations that every point in the sky is covered by at least one of them at all times; that doesn't require steering of the search dishes (it is desirable to have the best dishes steerable to allow fast followups, as Argus only wins over professional systems for short, one off, signals).

>But, as Mr. Spock always says, "There are always possibilities".

I'm not saying they should quit, I just am being realistic about the
outcome.

For a hobbyist interested in radio astronomy, SETI is probably not the best
project. There is near-zero chance of any result, which tends to get
frustrating in the long run.

I would instead try one of the more rewarding aspects of the hobby.

Hi all,
I have several questions about radio and the ISS could some one here answer them or point me to a web site with answers i would be most grateful.
1 What is the proposed date for ham radio to be activated?
2 What frequencies will they be using?
3 What frequencies do they use now that it is manned full time as it were?
4 Will they have SSTV capabilities as MIR has?
5 Is it right that one of the crew up their presently has a ham licence?

I think that's it many thanks in advance.

Fortunately, there are only two outcomes to SETI: either there is
life, or we don't know. I don't think you could ever confidently
say that there isn't.

>www.frequencyuk.co.uk

Launch of the first ISS crew, Expedition One, is set for the
morning of
October 31st, on a
Soyuz rocket from the Baikonur Cosmodrome. William Shepherd, KD5GSL,
is
the expedition commander. Yuri Gidzenko is the Soyuz vehicle
commander. Sergei Krikalev, U5MIR, is the flight engineer. NASA
Television plans
extensive coverage, beginning at 0200 EST on that date.

The flight to the ISS will take approximately two days, with a docking
expected on November 2nd. The crew has expressed a high level of
interest in
beginning amateur radio operations early in their mission but it may
be
several weeks
before they can setup the amateur radio station and begin operations
(probably no earlier than
November 14).

The crew may be using their own callsigns (KD5GSL, U5MIR) or they may
be
using one of the club stations allocated to the ISS: DL0ISS, NA1SS, or
RZ3DZR.

The Expedition One crew's activities are being scheduled around the
UTC
timeframe. It is expected that their working day will start around
0800
UTC and end near 1900 UTC. There may be a lunch break near 1200 UTC.

Passes near the beginning, lunchtime, and end of the crew day might be good times to find a crewmember relaxing with amateur radio activities.
The crew also has a "weekend" off from 1200 UTC on Saturday until the end of the day on Sunday. This might be another good time to listen for
crewmembers using the amateur radio equipment. Please remember that the
crew is using ham radio to relax from a very difficult job. They may, or may not, be interested in working a pile-up. They might be more interested in "rag chewing" with one or two hams on a given pass. Please respect each crewmembers different operating style.

It is not known yet how much power on board the ISS will be available for leaving the packet rig powered during times when the crew cannot perform voice contacts. We continue to request that the packet rig be left on as much as possible. The crew has been trained in the use of the beaconing capabilities, and we hope that they will use that to share
their experiences as the first permanent crew on the ISS. This is a "standard" AFSK AX.25 "terrestrial packet" rig, so it can be used for APRS and email can be sent to the crew. Please do not use the system to
leave email for other hams on the ground. Use the mailbox to leave email for the crew.

Initial operations will only take place on the 2m band. The tentative frequencies are:
Worldwide downlink for voice and packet: 145.80
Worldwide packet uplink: 145.99
Region 1 voice uplink: 145.20
Region 2 & 3 voice uplink: 144.49

Please remember to practice good operating practices and remain courteous and patient with this crew while they establish their ham operations preferences. Listen before transmitting, to make sure you don't step upon another QSO. Wait for the crew to call for contacts before transmitting. Please let others have a chance with a rare contact, don't monopolize the crew or the packet rig. Please do not ask
the crew to schedule school contacts or other schedules: this puts them
in an awkward and uncomfortable position. Information about requesting
dedicated contacts will be available on the ARISS web pages (http://ariss.gsfc.nasa.gov/) shortly.

QSLs and SWLs will be accepted and can be processed through Radio Amateurs of Canada or the American Radio Relay League. The card design
is being finalized, but should be ready for distribution early next

year. Details can be found on the ARISS web page.

The planning for school operations is actively underway, and efforts are
being made to have the first several school contacts before the end of
the year. It is hoped that several school contacts can be accommodated
each month, but the crew will be exceedingly busy and everyone must be
prepared to support more, or possibly, fewer school contacts. The
initial schools have been contacted and efforts are underway to finalize
the details of their contacts. The ARISS organization is beginning to
accept applications for school contacts; however, the crew workload will
determine the amount of time that passes between accepting an
application and when a contact is scheduled. We must all remember that
these are very early times for the ISS and we need to remain flexible in
pursuing amateur radio operations with the crews.

Please stay tuned to the ARISS web pages (http://ariss.gsfc.nasa.gov/)
for the latest information about frequencies and other operational
issues.

Tom

Gday,

I have been trying to locate any DOS/Win9x/Linux satellite
tracking programs that will allow me to specify two locations on earth
and then search for passes where the footprint of a satellite covers
both of the points.

I'm in a remote location and I can't seem to find any amateur satellites
that have a footprint large enough to go from wher I am to Australia or
South Africa.

Cheers,

Kym

It depends. If you have a post April 15th, 2000 restructured amateur radio psuedo-license, then your ham callsign & CB handle are interchangeable and you can freely use both anywhere.

If you have a real ham license, pre-April 15th 2000, you probably haven't seen a CB in years and wouldn't want to transmit on it anyway.

Follow the links from www.amsat.org and pick one. If you
don't like it, try another. Or consider writing your own:
the algorithms (SGP4 and friends) are published and readily
available.

If you want P3D you might also consider tossing some money
to AMSAT to help fund the project. The tracking programs
that cost money work very well.

My faves are predict and sattrack. YMMV.

Lots of interesting points - and as to S@H receiving gear and, more to the point, strategy, I've made a few fairly cutting posts her and on a.s.s and s.a.s myself recently! Frankly its one hell of a shot in the dark unless you can detect accidental emmisions, but then I've just got a new WU, so... .

Basicly few WU beam tracks contain a viable habitat for inteligent life(the insides of iridium satelites etc excluded ;)) so we're being a bit silly.

Fun though 'aint it?, Ed

Yet again you are assuming that ET's technology is less than or equal
to our own. Are you not willing to admit that the technological level
at which another civilization could have evolved could produce a hand
held device with intergalactic capabilities?

Mark

> When im talking in terms of recievers what is integration?

Averaging the output voltage. Strictly speaking, you get a voltage
proportional to the integral [you'll learn about those beasts in maths
lessons in a couple of years; great fun {;-( ] of voltage with respect to
time, hence the name.

S/N improves as the square root of the time constant. It's most often done
with analogue R/C circuits, or can be digital. The former is in basic
electronic tectbooks, the latter might use something like Simpsons Rule and
lots of processor power.

> What is the difference between a normal reciever and a total power
reciever?

blocking capacitors (basicly a crude high pass filter) in the audio
circuits.

> I think a total power reciever produces a DC current proportional to
antenna
> temperature, and is therefore more suited to radio astronomy, and a normal
> reciever produces an audio signal, which can then be processed and is
> therefore more suited to SETI.

I don't know a heck of a lot about standard electronic practice in seti,
but without a measurement of incoming flux your data will be of limited
scientific use if you do get a "Wow!" signal. all the audio fluctuations are
there in the total power data, you just might need to null some of the DC
out to keep inside your A/D converter's dynamic range.

In the unlikely event that our little green mates are using long CW pulses
to get our attention, an audio setup would miss them.

Yep.

>
> At the moment im still after a dish, and I spent about an hour on hold when
> I called Sky Channel to find out about the second-hand dishes they say they
> are getting rid of.

You could build one; make a load of parabolic metal strips (plot a big parabola in chalk on the garage floor?) put them together to form an "umbrella"and cover them in wire mesh. It'd be a hastle but the tolerances are only about 1inch at 21cm, and it's cheap. Remember - big is beautifull!

Eventually I gave up and decided it might be a good idea
> to study for my science yearly exam tomorrow.

By the way - if it's crossed your mind, don't do astrophysics at university unless you really, *really* want to go professional with it - just trust me on that! . Even then you might change your mind. But you might get to play with some nice big dishes. And if you're good at science on an intuitive level, then it's easy; so concentrate on learning your maths; it gets much harder. ;o)

Good luck, Ed.

Sorry I can't really help except to suggest you give the Intel-based
machines the heave-ho and find someone with a Macintosh!!!!

"MacDopplerPro" allows a "mutual coverage" prediction which will give you
the passes which favour contact between two separate locations. As to
whether anyone has incorporated such a capability into the Intel programs I
just don't know.

Funny, that "psuedo-license" gives those operators the same privileges
and authority to operate as a license issued before April 2000. So,
what are you saying about your own license - it is only worth as much as
a "psuedo-license?"

:-)
It's great isn't it!

I dream sometimes that we'll find something
out there very interesting and the consequences
of all that. It has to be a science of course, but also
it is like a detective looking for clues to solve
the big mystery of life in the Universe, or just a
good science fiction story (in my dreams anyway)...

Science is the way we'll do it though.

When Ernst Mayr says things like "impossible", or
"highly improbable", I'm not moved much, even
though he is a person of great knowledge and
respect. We don't know enough to make those
kind of claims ...

Al

I'd point my dish at elevation L one day, then at
elevation L+beamwidth/2 the next day, ..., etc.

I'd start probably just below the North Star where
I'm at along a great circle passing through the North
Star and my Zenith ... something like that is a good
strategy ...

Actually, several programs offer this capability. It is sometimes called
"mutual visibility", and is available in a freeware program called Satscape.
Just do a search with your favorite search engine for "satscape", and you
should find the home page. This capability is also available in Instant Track,
which is available from AMSAT for $50 for non-members. Some other programs
available for download from AMSAT's web site may also offer it.

Hi,
I develop the freeware program OrbSat and think that I'll add such feature
in weeks.
Let me think how to organize an interface.
If you have any suggestions dowload my program and let me know your ideas
and your thoughts how such a feature could be added in a convenient way for
user.
The link to program is

Riddle me this, Dwight: Suppose on/after 01 April 2010, no tests will
be required at all for an amateur radio license. Would this new license
be "worth" as much to you as the one you currently hold?

Is a GROL "worth" as much as the old First Class R/T Certificate?

Kym,
What have you tried for Linux?

I'd have thought that at least one of the applications at:

http://radio.linux.org.au/?sectpat=satellite&ordpat=title

would do what you want.

Sattrack would be the one I'd try first.

Terry

Predict for Linux, and WinOrbit for Windows. STSPlus for windows is also very nice, with a "Mission Control" look to it.

You're a good one to talk, Vince. Consider that, using your logic,
if you accidentally allowed your license to expire and then passed
all the exams to get back to extra, you would NOT be a "real ham".
Can you see just how stupid that logic is?

Satttrack 3.1.6 allows the selection of multiple groundstations and
displays the coverage in realtime mode, but as far as I know it cannot
pre-calculate when a given sat will be in range from two locations.

The 4.x versions undoubtedly can do this, but I have never dared to contact
the author for price info... maybe when I have setup a working station
again.

Rob

With all due respect, nothing could be further from the truth. The current license issued by the FCC is a real license by definition, Your bruised ego aside.

When you fly to Europe, are you not really getting there because other folks made the trip under much harder conditions on sailing vessels.

But! you knew that, and just enjoy being a troll!

I enjoy reminding people that ham radio is dumbed down now and when they don't accept the truth they resort to name calling. I think they do this because it makes them feel better inside.

Another plus for Predict is that if you don't like how it
displays the information, you can run it in server mode,
plug in to the socket and process the data yourself.

Remember also that Instantrack version 1.5 just came out at the AMSAT
convention this last week. This should do you very well as the Mutual
Window feature will do the job. It is not free but available from AMSAT
which uses the funds for satellite construction. Check:
http://www.amsat.org/amsat/instanttrack

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND DOLLARS: : READING THIS =
COULD CHANGE YOUR LIFE! IT DOES WORK! : I found this on a bulletin board =
and decided to try it. A little : while back, I was browsing through =
newsgroups, just like you are now, : and came across an article similar =
to this that said you could make : thousands of dollars within weeks =
with only an initial investment of : $6.00! So I thought, "Yeah right, =
this must be a scam", but : like most of us, I was curious, so I kept =
reading. Anyway, it said : that you send $1.00 to each of the 6 names =
and address stated in the : article. You then place your own name and =
address in the bottom of : the list at #6, and post the article in at =
least 200 newsgroups. : (There are thousands) No catch, that was it. So =
after thinking it : over, and talking to a few people first, I thought =
about trying it. I : figured: "what have I got to lose except 6 stamps =
and $6.00, : right?" Then I invested the measly $6.00. Well GUESS =
WHAT!?... : within 7 days, I started getting money in the mail! I was =
shocked! I : figured it would end soon, but the money just kept coming =
in. In my : first week, I made about $25.00. By the end of the second =
week I had : made a total of over $1,000.00! In the third week I had =
over : $10,000.00 and it's still growing. This is now my fourth week and =
I : have made a total of just over $42,000.00 and it's still coming in : =
rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more : =
than that on the lottery!! Let me tell you how this works and most : =
importantly, WHY it works... Also, make sure you print a copy of this : =
article NOW, so you can get the information off of it as you need it. : =
I promise you that if you follow the directions exactly, that you : will =
start making more money than you thought possible by doing : something =
so easy! : Suggestion: Read this entire message carefully! (print it out =
or : download it.) Follow the simple directions and watch the money come =
: in! : It's easy. It's legal. And, your investment is only $6.00 (Plus =
: postage) : IMPORTANT: This is not a rip-off; it is not indecent; it is =
not : illegal; and it is 99% no risk - it really works! : If all of the =
following instructions are adhered to, you will receive : extraordinary =
dividends. : PLEASE NOTE: : Please follow these directions EXACTLY, and =
$50,000 or more can be : yours in 20 to 60 days. This program remains =
successful because of : the honesty and integrity of the participants. =
```

Please continue its : success by carefully adhering to the instructions. =
: You will now become part of the Mail Order business. In this business =
: your product is not solid and tangible, it's a service. You are in : =
the business of developing Mailing Lists. Many large corporations are : =
happy to pay big bucks for quality lists. However, the money made : from =
the mailing lists is secondary to the income which is made from : people =
like you and me asking to be included in that list. : Here are the 4 =
easy steps to success: : STEP 1: Get 6 separate pieces of paper and =
write the following on : each piece of paper "PLEASE PUT ME ON YOUR =
MAILING LIST." Now : get 6 US $1.00 bills and place ONE inside EACH of =
the 6 pieces of : paper so the bill will not be seen through the =
envelope (to prevent : thievery). Next, place one paper in each of the 6 =
envelopes and seal : them. You should now have 6 sealed envelopes, each =
with a piece of : paper stating the above phrase, your name and address, =
and a $1.00 : bill. What you are doing is creating a service. THIS IS =
ABSOLUTELY : LEGAL! You are requesting a legitimate service and you are =
paying for : it! Like most of us I was a little skeptical and a little =
worried : about the legal aspects of it all. So I checked it out with =
the U.S. : Post Office (1-800-725-2161) and they confirmed that it is =
indeed : legal. Mail the 6 envelopes to the following addresses: : #1)=20

E. Benford : 6656 Mableton Pwky APT.#D4 : Mableton, GA.. 30126 : =
#2) Kim Williams : 3334 Kingsland Avenue : Bronx, NY 10469 : #3) Yury =
Konev : 823 Pavonia Avenue : Jersey City, NJ 07306 : #4 A. Campbell : =
P.O. Box 432 : Nellysford, VA.. 22958 : #5B. Page. PO Box 5024 Kendall =
Park NJ 08824 #6 Ewald Kerkhoff site 41 comp. 30 Penticton, B.C. V2A =
7K8 Canada : STEP 2: Now take the #1 name off the list that you see =
above, move : the other names up (6 becomes 5, 5 becomes 4, etc...) and =
add YOUR : Name as number 6 on the list. : STEP 3: Change anything you =
need to, but try to keep this article as : close to original as =
possible. Now, post your amended article to at : least 200 newsgroups. =
(I think there are close to 24,000 groups) All : you need is 200, but =
remember, the more you post, the more money you : make! You won't get =
very much unless you post like crazy. :) : This is perfectly legal! If =
you have any doubts, refer to Title 18 : Sec. 1302 & 1341 of the Postal =
lottery laws. : Keep a copy of these steps for yourself and, whenever =
you need money, : you can use it again, and again. : PLEASE REMEMBER =
that this program remains successful because of the : honesty and =
integrity of the participants and by their carefully : adhering to the =
directions. Look at it this way. If you are of : integrity, the program =
will continue and the money that so many : others have received will =
come your way. : NOTE: You may want to retain every name and address =
sent to you, : either on a computer or hard copy and keep the notes =
people send you. : This VERIFIES that you are truly providing a service. =
(Also, it might : be a good idea to wrap the $1 bill in dark paper to =
reduce the risk : of mail theft.) : So, as each post is downloaded and =
the directions carefully followed, : six members will be reimbursed for =
their participation as a List : Developer with one dollar each. Your =
name will move up the list : geometrically so that when your name =
reaches the #1 position you will : be receiving thousands of dollars in =

CASH!!! What an opportunity for : only $6.00 ($1.00 for each of the =
first six people listed above) Send : it now, add your own name to the =
list and you're in business! : ---DIRECTIONS ----- FOR HOW TO POST TO =
NEWSGROUPS---------- : Step 1) You do not need to re-type this entire =
letter to do your own : posting. Simply put your cursor at the beginning =
of this letter and : drag your cursor to the bottom of this document, =
and select 'copy' : from the edit menu. This will copy the entire letter =
into the : computer's memory. : Step 2) Open a blank 'notepad' file and =
place your cursor at the top : of the blank page. From the 'edit' menu =
select 'paste'. This will : paste a copy of the letter into notepad so =
that you can add your name : to the list. Step 3) Save your new notepad =
file as a .txt file. If : you want to do your postings in different =
settings, you'll always : have this file to go back to. : Step 4) Use =
Netscape or Internet explorer and try searching for : various newsgroups =
(on-line forums, message boards, chat sites, : discussions.) : Step 5) =
Visit these message boards and post this article as a new : message by =
highlighting the text of this letter and selecting paste : from the edit =
menu. Fill in the Subject, this will be the header that : everyone sees =
as they scroll through the list of postings in a : particular group, =
click the post message button. You're done with : your first one! =
Congratulations...THAT'S IT! All you have to do is : jump to different =
newsgroups and post away, after you get the hang of : it, it will take =
about 30 seconds for each newsgroup! **REMEMBER, THE : MORE NEWSGROUPS =
YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT : YOU HAVE TO POST A =
MINIMUM OF 200** That's it! You will begin receiving : money from around =
the world within days! You may eventually want to : rent a P.O.Box due =
to the large amount of mail you will receive. If : you wish to stay =
anonymous, you can invent a name to use, as long as : the postman will =
deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE : CORRECT.** : Now, : =
each of the 5 persons who just sent me $1.00 make the MINIMUM 200 : =
postings, each with my name at #5 and only 5 persons respond to each : =
of the original 5, that is another $25.00 for me, now those 25 each : =
make 200 MINIMUM posts with my name at #4 and only 5 replies each, I : =
will bring in an additional $125.00! Now, those 125 persons turn : =
around and post the MINIMUM 200 with my name at #3 and only receive 5 : =
replies each, I will make an additional $625.00! OK, now here is the : =
fun part, each of those 625 persons post a MINIMUM 200 letters with : my =
name at #2 and they each only receive 5 replies, that just made me : =
$3,125.00!!! Those 3,125 persons will all deliver this message to 200 : =
newsgroups with my name at #1 and if still 5 persons per 200 : =
newsgroups react I will receive $15,625,00! With an original : =
investment of only $6.00! AMAZING! When your name is no longer on the : =
list, you just take the latest posting in the newsgroups, and send : out =
another $6.00 to names on the list, putting your name at number 6 : =
again. And start posting again. The thing to remember is: do you : =
realize that thousands of people all over the world are joining the : =
internet and reading these articles everyday?, JUST LIKE YOU are : now!! =
So, can you afford $6.00 and see if it really works?? I think : so... =
People have said, "what if the plan is played out and no : one sends you =
the money? So what! What are the chances of that : happening when there =

are tons of new honest users and new honest : people who are joining the =
internet and newsgroups everyday and are : willing to give it a try? =
Estimates are at 20,000 to 50,000 new : users, every day, with thousands =
of those joining the actual : internet. Remember, play FAIRLY and =
HONESTLY and this will really : work.=20

money in=20
the mail! I was shocked! I : figured it would end soon, but the =

money just=20
kept coming in. In my : first week, I made about $25.00. By the =
end of the=20
second week I had : made a total of over $1,000.00! In the third =
week I=20
had over : $10,000.00 and it's still growing. This is now my =
fourth week=20
and I : have made a total of just over $42,000.00 and it's still =
coming in=20
: rapidly. It's certainly worth $6.00, and 6 stamps, I have spent =
more :=20
than that on the lottery!! Let me tell you how this works and most =
:=20
importantly, WHY it works... Also, make sure you print a copy of =
this :=20
article NOW, so you can get the information off of it as you need =
it. : I=20
promise you that if you follow the directions exactly, that you : =
will=20
start making more money than you thought possible by doing : =
something so=20
easy! : Suggestion: Read this entire message carefully! (print it =
out or :=20
download it.) Follow the simple directions and watch the money =
come : in!=20
: It's easy. It's legal. And, your investment is only $6.00 (Plus =
:=20
postage) : IMPORTANT: This is not a rip-off; it is not indecent; =
it is not=20
: illegal; and it is 99% no risk - it really works! : If all of =
the=20
following instructions are adhered to, you will receive : =
extraordinary=20
dividends. : PLEASE NOTE: : Please follow these directions =
EXACTLY, and=20
$50,000 or more can be : yours in 20 to 60 days. This program =
remains=20
successful because of : the honesty and integrity of the =
participants.=20
Please continue its : success by carefully adhering to the =
instructions. :=20
You will now become part of the Mail Order business. In this =
business :=20
your product is not solid and tangible, it's a service. You are in =
: the=20
business of developing Mailing Lists. Many large corporations are =
: happy=20
to pay big bucks for quality lists. However, the money made : from =
the=20
mailing lists is secondary to the income which is made from : =

people like=20
you and me asking to be included in that list. : Here are the 4 =
easy steps=20
to success: : STEP 1: Get 6 separate pieces of paper and write the =

following on : each piece of paper "PLEASE PUT ME ON YOUR MAILING =
LIST."=20
Now : get 6 US $1.00 bills and place ONE inside EACH of the 6 =
pieces of :=20
paper so the bill will not be seen through the envelope (to =
prevent :=20
thievery). Next, place one paper in each of the 6 envelopes and =
seal :=20
them. You should now have 6 sealed envelopes, each with a piece of =
: paper=20
stating the above phrase, your name and address, and a $1.00 : =
bill. What=20
you are doing is creating a service. THIS IS ABSOLUTELY : LEGAL! =
You are=20
requesting a legitimate service and you are paying for : it! Like =
most of=20
us I was a little skeptical and a little worried : about the legal =
aspects=20
of it all. So I checked it out with the U.S. : Post Office=20
(1-800-725-2161) and they confirmed that it is indeed : legal. =
Mail the 6=20
envelopes to the following addresses: : #1)

E. Benford =
: 6656=20
Mableton Pwky APT.#D4 : Mableton, GA.. 30126 : #2) Kim Williams : =
3334=20
Kingsland Avenue : Bronx, NY 10469 : #3) Yury Konev : 823 Pavonia =
Avenue :=20
Jersey City, NJ 07306 : #4 A. Campbell : P.O. Box 432 : =
Nellysford, VA..=20
22958 : #5B. Page. PO Box 5024 Kendall Park NJ 08824 #6 Ewald =
Kerkhoff=20
site 41 comp. =
30 Penticton, B.C. V2A 7K8 =
Canada :=20
STEP 2: Now take the #1 name off the list that you see above, move =
: the=20
other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR : =
Name as=20
number 6 on the list. : STEP 3: Change anything you need to, but =
try to=20
keep this article as : close to original as possible. Now, post =
your=20
amended article to at : least 200 newsgroups. (I think there are =
close to=20

24,000 groups) All : you need is 200, but remember, the more you =
post, the=20
more money you : make! You won't get very much unless you post =
like crazy.=20
:) : This is perfectly legal! If you have any doubts, refer to =
Title 18 :=20
Sec. 1302 & 1341 of the Postal lottery laws. : Keep a copy of =
these=20
steps for yourself and, whenever you need money, : you can use it =
again,=20
and again. : PLEASE REMEMBER that this program remains successful =
because=20
of the : honesty and integrity of the participants and by their =
carefully=20
: adhering to the directions. Look at it this way. If you are of : =

integrity, the program will continue and the money that so many : =
others=20
have received will come your way. : NOTE: You may want to retain =
every=20
name and address sent to you, : either on a computer or hard copy =
and keep=20
the notes people send you. : This VERIFIES that you are truly =
providing a=20
service. (Also, it might : be a good idea to wrap the $1 bill in =
dark=20
paper to reduce the risk : of mail theft.) : So, as each post is=20
downloaded and the directions carefully followed, : six members =
will be=20
reimbursed for their participation as a List : Developer with one =
dollar=20
each. Your name will move up the list : geometrically so that when =
your=20
name reaches the #1 position you will : be receiving thousands of =
dollars=20
in CASH!!! What an opportunity for : only $6.00 ($1.00 for each of =
the=20
first six people listed above) Send : it now, add your own name to =
the=20
list and you're in business! : ---DIRECTIONS ----- FOR HOW TO POST =
TO=20
NEWSGROUPS---------- : Step 1) You do not need to re-type this =
entire=20
letter to do your own : posting. Simply put your cursor at the =
beginning=20
of this letter and : drag your cursor to the bottom of this =
document, and=20
select 'copy' : from the edit menu. This will copy the entire =
letter into=20
the : computer's memory. : Step 2) Open a blank 'notepad' file and =

place=20
your cursor at the top : of the blank page. From the 'edit' menu =
select=20
'paste'. This will : paste a copy of the letter into notepad so =
that you=20
can add your name : to the list. Step 3) Save your new notepad =
file as a=20
.txt file. If : you want to do your postings in different =
settings, you'll=20
always : have this file to go back to. : Step 4) Use Netscape or =
Internet=20
explorer and try searching for : various newsgroups (on-line =
forums,=20
message boards, chat sites, : discussions.) : Step 5) Visit these =
message=20
boards and post this article as a new : message by highlighting =
the text=20
of this letter and selecting paste : from the edit menu. Fill in =
the=20
Subject, this will be the header that : everyone sees as they =
scroll=20
through the list of postings in a : particular group, click the =
post=20
message button. You're done with : your first one!=20
Congratulations...THAT'S IT! All you have to do is : jump to =
different=20
newsgroups and post away, after you get the hang of : it, it will =
take=20
about 30 seconds for each newsgroup! **REMEMBER, THE : MORE =
NEWSGROUPS YOU=20
POST IN, THE MORE MONEY YOU WILL MAKE! BUT : YOU HAVE TO POST A =
MINIMUM OF=20
200** That's it! You will begin receiving : money from around the =
world=20
within days! You may eventually want to : rent a P.O.Box due to =
the large=20
amount of mail you =
will=20
receive. If : you wish to stay anonymous, you can invent a name to =
use, as=20
long as : the postman will deliver it. **JUST MAKE SURE ALL THE =
ADDRESSES=20
ARE : CORRECT.** : Now, : each of the 5 persons who just sent me =
$1.00=20
make the MINIMUM 200 : postings, each with my name at #5 and only =
5=20
persons respond to each : of the original 5, that is another =
$25.00 for=20
me, now those 25 each : make 200 MINIMUM posts with my name at #4 =
and only=20

5 replies each, I : will bring in an additional $125.00! Now, =
those 125=20
persons turn : around and post the MINIMUM 200 with my name at #3 =
and only=20
receive 5 : replies each, I will make an additional $625.00! OK, =
now here=20
is the : fun part, each of those 625 persons post a MINIMUM 200 =
letters=20
with : my name at #2 and they each only receive 5 replies, that =
just made=20
me : $3,125.00!!! Those 3,125 persons will all deliver this =
message to 200=20
: newsgroups with my name at #1 and if still 5 persons per 200 :=20
newsgroups react I will receive $15,625,00! With an original : =
investment=20
of only $6.00! AMAZING! When your name is no longer on the : list, =
you=20
just take the latest posting in the newsgroups, and send : out =
another=20
$6.00 to names on the list, putting your name at number 6 : again. =
And=20
start posting again. The thing to remember is: do you : realize =
that=20
thousands of people all over the world are joining the : internet =
and=20
reading these articles everyday?, JUST LIKE YOU are : now!! So, =
can you=20
afford $6.00 and see if it really works?? I think : so... People =
have=20
said, "what if the plan is played out and no : one sends you the =
money? So=20
what! What are the chances of that : happening when there are tons =
of new=20
honest users and new honest : people who are joining the internet =
and=20
newsgroups everyday and are : willing to give it a try? Estimates =
are at=20
20,000 to 50,000 new : users, every day, with thousands of those =
joining=20
the actual : internet. Remember, play FAIRLY and HONESTLY and this =
will=20
really : work.

> > friends may need to do the old cavemans trick of banging two galaxies
> > together. (cue- "Fanfare to the Common Man") :^)
>
> Yet again you are assuming that ET's technology is less than or equal
> to our own.

Not in the least; I'm most concerned about our stupidity, not theirs :o)
Also it seems reasonable to believe that there would be fewer societies surviving long enough to reach a highly advanced level, so lets play the odds and look for lots of nearby societies within a few centuries of our own technology, not one tens of megaparsecs away.

>Are you not willing to admit that the technological level
> at which another civilization could have evolved could produce a hand
> held device with intergalactic capabilities?

No; not so that *we* can hear it anyhow. Maybe there's some loophole in human knowledge physics that lets them comunicate with each other, but not with creatures as thick us. Indeed, if they're that smart, what are we to them beyond underdeveloped anthropological curiosities?

I'm simply assuming the laws of physics and including our own, still very limited, capacity to receive. To be heard with S@H (let alone an amateur rig), a hand held radio device such as you describe would fry you, and a few nearby solar systems too. Indeed the energy density might even be so great that it would collapse forming a black hole and thus transmit nothing at all!

Let's accept that maybe a sufficiently advanced civilisation could attempt to modulate the accretion of matter onto a super-massive black hole or build a synchrotron the size of a small galaxy for use as a beacon, etc.; but why waste their time calling some stupid apes who they won't meet in millions of years? "Ah! But they could come here through a wormhole or faster than light etc." I hear you say. If (one hell of a big if, IMO) that's so, why don't they do that in the first place?

The energies required, regardless of technology, are so great that it would be rather like humanity setting off all the world's nuclear weapons in order to try to attract the attention of some critters with 20th centuary telescope technology on a planet orbiting a nearby star. To miss-quote Carl Sagan: Maybe the sound when you put a seashell to your ear is an ET signal if you analyse it correctly - but I doubt it! Equaly, maybe we can see the artifacts of super-advanced civilisations as, for example, some gamma ray bursts or active galactic nuclei, but I personaly doubt it *very* much.

"But what if they don't use radio (or other electomagnetic) waves?" Then we won't hear them anyway unless we already know the physics and can build the receiver - and indeed to realise the potentialities of what we've already built. So maybe we have to be as advanced as they are to notice them. Ed.

But then, who knows? ;^)

IMO the "possible, but only just" is a v. expensive (scientificaly and financialy) luxuary. I'm concerned with what it's worth doing for a fair to middling chance of success, and what it's justifiable to spend tax payers money on, etc.. I'd love to be alive when the real "Wow!" signal is received, so forget those rare extragalactic geniuses; lets concentrate on the average "thousands(??) in every galaxy" Little Green Critters within a kiloparsec or so of us first.

keep looking anyway, Ed.

Vince has said that anyone who gets a license after April 2000 is not a real ham. That would include hams who accidentally allowed their license to expire and took the exams in order to get their license back. So don't dare let your license expire, Dick, 'cause Vince says you will no longer be a real ham. If you let your license expire and go to the trouble of taking the exams to get it back, you will be dumbed-down and branded an Extra Lite.

I have been working the analog sats for about three years now. During that time I have caught RS15 operational about four times. Last night I was driving home from work, 10 meters was dead so I turned the squelch down and set it to scan the 10 meter band. It stopped at 29.352 on a rather weak CW signal. I thought it might be the RS15 beacon so when I got home I checked and, sure enough, it was making a pass over central US at that time.

Greetings! I'm about to take the exam and get my license. Since the crew is headed up to ISS I am interested in trying to communicate with them. However, I have no idea where to start.

Can some of you fine people share some recommendations about books and websites to get a newbie going in the world of sattelite communications?

Thanks!

Brendan

> you as the one you currently hold?

Of course it would. It would still give me the same operating privileges, and authority to operate, as I had before, so how could it be "worth" less just because the requirements changed for someone else? All my friends would still on the radio, so a change in the license requirements would not lesson that. My enjoyment of radio would still be there, so a change in the license requirements would not lesson that. I simply don't see how the value of my license to me could be reduced by a change in the requirements for someone else.

By the way, I posted this a couple of days ago, but someone set follow-ups to just rec.radio.amateur.misc and I didn't notice it until today. So I'm reposting it so it will appear back in rec.radio.amateur.policy.

2619. ISS DOWNLINK HEARD IN UK

Newsgroup: rec.radio.amateur.space
Date: 2000-11-02 14:23:25 UTC
From: Eavesdropper <ian@eavesdropper.worldonline.co.uk>
Message-ID: <3a017930@news.server.worldonline.co.uk>
Source record: 8153
Cross-posted to: alt.radio.scanner.uk,rec.radio.amateur.space

At 13:56 pm GMT today I was driving along in the pouring rain and remembered that the russian VHF downlink eqipement was already onboard the ISS so i quickly tuned to the old MIR frequency of 143.6250 NFM and low and behold they where there, talking in Russian just like the old MIR days.

I manage to record around 3 minutes of it in real media format on my laptop when i pulled over to the side of the road , unfortunately in my haste I left it in maximum quality format and it is 1.6mb in size so I may post it to alt.binaries.radio.scanner if anybody wishes me to.

If you are interested in hearing her the next passes (UK) are as follows.... (expand this window full screen to see properly)

Please note these passes are VISIBLE passes so may well see it to if there are clear skies, also all times are GMT for UK locations.

```

ISS is on 143.625 MHz (Russian)
The Americans use digital microwave systems via relay satellites, you won't
be able to listen in on those.

Maybe you have missed it, but these days the Russians and Americans are
co-operating on the same space station.

I don't think they would be willing to sacrifice their star to send a signal
to that could be received by a 3 or 5 meter dish. Modulating the signal
might be a little difficult, and what would they do for a repeat
performance? Or maybe they could be a little more clever and place a Dyson
sphere around a pulsar and use polarizers to modulate the beam? I think it
might be cheaper and faster for an ETI civilization to send von Neumann
probes. Of course, given that capability and choice, we should be looking
for signals in our solar system.

A list of Earth based ham relays of the voice from NASA TV is available
at http://www.amsat.org/amsat/sarex/shutfreq.html

But you might be able to copy the VHF signals direct from ISS on certain
passes when it is visible from both Indiana and the East and West
coasts...

Left a tape (voice activated) running on 143.625 all day today (Fri) and caught a few minutes of conversation in Russian. No idea which pass these recordings were made from as the machine does not time-stamp. I'll have to fire up the laptop and record it there.

If you do the same, remember to enable the AFC if you have one (I forgot). Doppler shift means the station can be a few kHz off frequency and the first snatches of voice on the tape are all clipped as a result.

Is MIR finally demanned now or do they still have a presence - also on 143.625??

Martin

NASA installed VHF ground stations at Wallops, White Sands, and Dryden when American astronauts started visiting MIR. The VHF sites could be scheduled by the Russians (even when Americans weren't aboard) for communicating with the cosmonauts. These VHF stations are now being used for ISS and Soyuz. I'm pretty sure that ISS and Soyuz use different frequencies.

Using a Russian frequency for Ground Network contacts makes sense when you think about it. You wouldn't want the crew to have to think about which country they are over (and hence which frequency to use) before they transmit. They should only need to have a schedule of possible contact times.

Tim

Rick,

There aren't any ISS/Soyuz VHF stations in the midwest, and I'm not aware of any relays. However, ISS can communicate through Wallops when it is pretty far west, and I'd expect that you could copy the downlink from Central Indiana without any problem - during those passes. Of course, if ISS was communicating through Wallops while it was over the Atlantic, I doubt that you'd hear anything.

If you have software to predict passes, you could look for times when ISS is simultaneously in view from your location and from Wallops. The location of Wallops is:

Latitude: 37 degrees 55 minutes, 41.55 seconds

Longitude (West): -75 degrees 28 minutes 33.23 seconds

For others interested, White Sands is at:

Latitude: 32 degrees 30 minutes 33.89 seconds

Longitude (East): 253 degrees 23 minutes 31.1385 seconds

And Dryden is at:

Latitude: 34 degrees 57 minutes 38.8969 seconds

Longitude (East): 242 degrees 5 minutes 18.6141 seconds

Good luck & 73,

Tim

Something I don't quite understand here.

Listening to the NASA TV during the wee hours of the morning (afternoon in Moscow), the Alpha-ISS occupants had short periods of communuications while the station was over russian territory, and towards the conclusion of that period, there was an agreement that the next communication pass would occur in X minutes (next orbit). And then silence.

During those silence portions, NASA TV commentator would make comments that telemetry was being transmitted via the Unity early communications system.

If the crew are told not to bother with the radio for the next 80 minutes, I am currious as to why anyone in north america would hear convesations as the station was over north america ?

Or during daytime orbits that go over the USA, would the crew be advised of additional communications opportunities ? But aren't they asleep during north american daytime ?

Also, what exactly is the Unity early communications system capable of ? Could it handle voice communcations ? Or just telemetry ?

I suspect they have more sales to the general public. I can't remember
where this model is in their range, but I think that most of the range
is aimed at the hobbyist scanner market.

> military, or intelligence service type of equipment than SETI equipment. In
> addition, it is not nearly sensitive enough for SETI work, and is possibly

Sensitivity of the main receiver is not generally an issue. The main
receiver needs good frequency stability, and few birdies. A large
dynamic range is also desirable. However, in a typical configuration,
the downlead cable is likely to generate more noise than the receiver

The main concern with software controlled receivers like this is
RFI from the PC. The model in question is an external one, though,
so good isolation should be possible to achieve, and it is claimed
that the internal ones have reasonable isolation as well.

> illegal in many countries.
[IANAL]
The manufacturer is Australian and the potential buyer is Australian, in
this case. I suspect that versions sold to the public in the USA will
have the cellular bands disabled, to meet the US legislation (not that
that provides any real security for analogue cellular). In the UK
possession is OK, but use for monitoring anything not intended for
the general public is illegal, and having it ready for such use is
probably also illegal (this also applies to general coverage short
wave receivers). Listening to taxis and the police is illegal in the
UK.

> What you need is a directional dish (greater gain and less noise,) a low
> noise amplifier and block down converter built into the antenna, and a

I've never heard of an amateur SETI station that uses feed point
downconvertors. Cable losses are acceptable at 1.42GHz and an indoor
convertor is likely to be more frequency stable. TVRO systems can
tolerate quite poor stablity.

> receiver that works in the narrow range around the waterhole frequency, say
> 1.4 GHz to 1.44 GHz. Then you need to record the reception or process

Most people "listen" there, but there is no fundamental reason for doing so. Waterhole is used to mean at least three different frequency ranges, one of which is 1000s of MHz wide. I think you mean the neutral hydrogen line (hyperfine transition of atomic hydrogen).

A lot of people want black box level solutions, so, whilst the cheapest solution amounts to a (not quite) simple downconvertor, many, if not most, people use ICOM 7600 microwave scanning receivers. They also have the advantage that they can be used for listening to amateur bands, and, one suspects, other communication bands, if one gets bored with SETI. If the worst comes to the worst, one can also sell it second hand (and if one bought it second hand, one may not lose much, other than the cost of money).

A popular solution for those into radio engineering (and a lot of amateur radio operators these days are not) is to down convert to the 2m amateur band using a fairly conventional convertor, then downconvert to to baseband++ with a direct conversion design (a design called the R2 seems popular).

One proposal, from the UK, is the use of adapted ex-PMR (private mobile radio) equipment. (Such equipment is often adapted for the amateur bands and provides a halfway house between black boxes and constructing from scratch for amateurs who want to get involved with the technology.)

> real-time with a computer. There a PCI cards available for a PC (in the
> $200 US range) that act as a spectrum analyzer. The dish is probably the

The normal amateur SETI configuration uses a sound card and a software spectrum analyzer. For a person just starting, that tends to have a zero marginal cost, and doesn't require access to specialist suppliers. They are also much more comfortable with consumer commodity hardware. Also, although computer hardware goes off in value much faster than radio hardware, there is a second hand market accessible to the hobbyist, so one is not commiting the full cost permanently.

One tends to need to modify standard receiver designs rather a lot (10.7MHz IF output on commercial scanners and much wider filters on direct conversion type designs) before you exceed the capabilities of a modern PC and sound card. Also, most of the sort of software that would be suitable for the average S@H user on these newsgroups is designed for a PC/sound card configuration.

> I've seen a website that advertises LNA's, LNB's, and receivers for SETI.

I'm pretty certain (s)he has already indicated that (s)he is in contact with the primary supplier of amateur 1.42GHz radio astronomy and SETI hardware (Down East). I also believe (s)he has already investigated sources of dishes.

> By the way, the 5.5 m steerable dish I operated for ten years cost about
> $115,000 US and required three-phase 480 volts AC to operate the positioning

3m is the standard size, i.e. ex-C band TVRO. Many people simply fix them pointing at the local zenith.

I tend to get the impression that, whilst they are still learning, the questioner has researched this area better than you have. Amateurs often adapt equipment in ways that professionals would not normally do.

++ baseband is used loosely in as much as it is only strictly meaningful when you know the structure of the signal you are trying to receive.

Ed Nelson <ednelson@waitrose.com> wrote:

> S/N improves as the square root of the time constant. It's most often done

Provided the signal stays in band. Unless you chirp the local oscillator,
the signal won't stay in band for amateur dish transit times, even with
amateur receiver channel bandwidths (1 to 10Hz). I have a feeling that,
even if you do chirp the local oscillator, the variation in chirp will
take the signal out band.

Although I have reservations, the normal tactic is to integrate for
about a minute numerically, then look for patterns visually, thus
effectively integrating along sequences of spikes. The SETI League
sites has examples.

> with analogue R/C circuits, or can be digital. The former is in basic
> electronic tectbooks, the latter might use something like Simpsons Rule and
> lots of processor power.

Simpson's rule is mainly for hand calculation. Any integration in
this context would be done by simply adding the samples together.
(In particular, Simpson's rule assumes a low order polynomial fit to a
curve, which is not the situation one has here - the measured curve
is noise like.)

> In the unlikely event that our little green mates are using long CW pulses
> to get our attention, an audio setup would miss them.

No, an audio setup is almost essential. SETI is always done with an
SSB type receiver configuration, so a CW signal will come out as a tone,
not a DC component. That tone can be so weak as to be inaudible, but
by running it through an FFT you can isolate the tone.

You do not want total power systems for SETI, only for continuum radio
astronomy.

Amateur SETI, and many professional systems, integrate the output of the
FFT. S@H doesn't, or at least not in a simple way (the gaussian matching
improves S/N in a similar way to integration). The integration is done
digitally, and independently on every channel. I think project Phoenix
also tries varying chirps during the integration, using special hardware.

> Quote from article [by Dr Shuch]:
> sky at any time. To avoid missing the call, we really need about a million
> such radio telescopes, coordinated so as to point in all directions at

You need to realise that each strategy has strengths and weaknesses;
Dr Shuch is stressing the proportion of time for which any target is
observed, because that is the strength of amateur SETI. Its weakness is
a lack of range. He's on a selling mission, trying, at the same time,
to leverage the S@H publicity and stop people abandoning Argus for S@H.

A 300m dish, like Arecibo, has 100 times the range of a 3m dish, and
therefore can sweep 1,000,000 times the volume, for a given transmit
power. However, Arecibo, in SERENDIP type configuration, can only manage
around 12 seconds per target every six or so months, even within its
limited pointing range; if it could point in any direction, it would
take several years to give each target 12 seconds.

If the transmitted signal lasts several years, that doesn't matter, and
Arecibo has a million times better a chance of finding it than an amateur
(assuming it is strong enough for the statistics to be well behaved++).
However, if it only lasts 12 seconds, the chance of the right 12 seconds
being hit is very small (of the order of 1/(50,000,000)).

On the other hand, a relatively small number of 3m dishes can
simultaneously cover the whole sky and only suffer the 1,000,000
sensitivity penalty, not the 5,000,000 right time penalty.
Over-committing the coverage gives you real time confirmation.

The above figures are very order of magnitude and make a lot of
unstated assumptions, but, I believe, the conclusions are right.

For our own high power leakage, 30 minutes might be more reasonable
than 12 seconds, shifting the balance towards the the big dishes,
but still near break-even. (Actually, the reaction time to even
a 30 minute signal wouldn't allow a confirmation observation, so
over-committed small dishes still have an advantage.)

Note that amateur SETI only gets these advantages when done in
a coordinated fashion, and, for example, anyone who insists on only
looking at the "best candidates" will optimise their individual chance
of success but reduce the overall chance.

> Most SETI amateurs swear by the iCom R7000 receiver or similar in the

This is the preferred plug and play solution. Some use home or kit constructed receivers of relatively simple designs, but still having all the required attributes except for frequency agility (which is not actually that much of a priority in the above scenario, as stepping the frequency means that you are not looking at the target for as long as possible).

++ When it is not strong, there may be hundreds of stars in range of Arecibo and none at all in range of a 3m dish. The Argus concept really requires there to be 100s of candidates in the range of the small dishes for the statistics to be well behaved.

Book',
An intermediate frequency is a frequency that when
mixed with the incoming signal frequency, produces a
third frequency which would be in a frequency range
that you wish. The third frequency being easier to
manipulate (for what ever reason) than the original
one.
Tuning resolution means how small of a change in
frequency can be made by moving the tuning knob. The
lowest frequency division that the radio is capable of
making. It is not the same as bandwidth.

2655. Power masthead pre-amp through separte PA

Newsgroup: rec.radio.amateur.space
Date: 2000-11-03 10:22:20 UTC
From: PPAK <ppakotze@ing.sun.ac.za>
Message-ID: <3A0291DC.7E8D4161@ing.sun.ac.za>
Source record: 8189

Hallo I have been trying to modify a Tokyo UHF power amp to power a masthead Icom pre amp.

Normally the Icom pre amp receive 12V from the transceiver to switch on the pre amp for reception. When the PTT on the transceiver is pressed this 12V is removed to bypass the sensitive low noise transistor stage. The UHF PA is not DC connected so by inserting the UHF PA no power is available from the transceiver to the masthead pre amp.

The UHF PA I am using has an internal pre amp which automatically senses RF to switch the internal pre amp in and out. My first attempt used the power supply from this internal pre amp to power the masthead pre amp as well. This method cost met two new low noise transistors in the masthead pre amp! I connected the power supply from the internal pre amp to the antenna input of the UHF PA through some RF chokes beads and diodes to keep RF out of the power supply circuitry. On the workbench I can see and hear the masthead relays clicking in and out. Somewhere some RF must still be getting into the low noise transistor as they are still destroyed.

As a second attempt I am going to try and use the 12V from the transceiver to power the masthead pre amp by making a DC bypass around the UHF PA. I am thinking of using a 1/4 wave coax line from the UHF PA transceiver side 'shorted' with a capacitor to ground and from the capacitor to the UHF PA antenna side another 1/4 wave. My thinking is that this will block the RF intended to go the normal route through the UHF PA but will allow the DC from the transceiver to still switch the masthead pre amp.

Is this possible? Bandwidth might be a bit narrow but then this is only intended for satellite use. Or are there more reliable ways? (Am I reinventing the wheel?) Any info will be most welcome.

Everyone says to listen at the hydrogen absorption freq
of 1.4 GHz to 1.44 GHz. Since there's more hydrogen
around then anything else, seems like most of any energy
at that freq would go to exciting hydrogen atoms.
Small wonder it's so "quiet."

Why this freq? Seems an ambigious, even anthropomorphic choice
to me. I'd think if ET were out there, he'd probably be using
a whole lot of other freqs, just like we do.

My guess is that your amplifier is too slow in automatically sensing RF and the masthead amp is destroyed by that short time the power is going straight through.

This essentially cannot be solved. The RF that is being detected for switchover purposes is always going through to the masthead amp, and while the time may be reduced it can never be zero.

What you should do is use the DC power from the transceiver to key the amplifier and switch the relays in the masthead. Get some DC from the input, and use it to key everything and to provide DC on the output.

The drop of DC power will precede the RF output, and so everything switches in the right sequence.

Every receiver -- very few exceptions -- takes whatever frequency you want to listen to and converts it to another one. This is because it is easier to build in features like filters and for that matter the 10 billion or so gain or amplification factor you need to do radio right if the frequency it has to work at is known. So your AM radio converts to 455 khz, your FM uses 10.7 MHz, and whatever TV channel you are watching ends up with the picture at 45.75 MHz and the sound at 41.75 in the US at least (I note the au). Because of manufacturing and cost considerations, these i.f. freqs are fairly universal. Think of it as a single freq radio with a variable tuner hung on the front end that handles different frequencies by converting them to whatever the real radio behind it wants, the intermediate frequency.

Tuners these days do things in steps rather than the continuous tuning of yesteryear. So tuning resolution is really the size of the steps it takes. For AM, nine or ten KHz depending on where you live is great, FM is in 100 or 200 kHz steps, TV can be in six, seven, or eight MHz steps. Shortwave can be done in 5 KHz steps and get most of what is on but it is better done in .5 or 1 kHz steps. Where the pilot method of frequency assignment is used (pile it here, pile it there) as on the ham bands, 0.1kHz steps are needed. If you want to do SSB, there is a continuously variable thingee in there somewhere.

Don't get the idea that a smaller resolution is necessarily better for all purposes. Tuning across the entire 25 meter band .1kHz at a time will give you carpel tunnel holding the knob and cause you to forget why you turned the knob to begin with. Most amateur gear depending on your touch on the knob can do .1 but kicks it up to get across the band sometime while you are still alive.

Hope all of this makes some kind of sense.

I thought the theory was that any distant intelligent alien
would be deliberately transmitting on this frequency (because
it's constant and hydrogen is so simple etc) to attract the
attention of slightly less intelligent aliens like ourselves.

Note that we don't transmit on this frequency ourselves
to attract slightly less intelligent again aliens, so
I wonder if this theory is really any good.

IF - Intermediate Frequency -- Intermediate frequency, resultant
frequency from heterodyning the carrier
frequency with an oscillator, mixing incoming signals to an
intermediate frequency enhances amplification,
filtering and the processing signals. It is desirable to have more
than one IF. (Dual conversion, triple conversion etc)
For example in an AM radio when you tune to 1600kHz -- this is beat
against a local oscillator to yield an intermediate frequency of 455kHz,
this is fed to a detector which strips off the audio frequency.

This scheme is termed A "Superheterodyne Receiver"

For more on "How a Radio Works -- see URL:
http://www.ezlink.com/~crash/parks/hetbasic.html#suphetblk
AND
http://www.electronics-tutorials.com/receivers/receivers.htm

In modern radios, rather than analog (continuos tuning), synthesized
tuning is used and it tunes in steps (5kHz, 2kHz, 1kHz, etc.) --- this
is tuning resolution -- has nothing to do with bandwidth.

Bandpass or bandwidth is the range of frequencies permitted to pass
through a filter or receiver circuit. AM requires about 5kHz, SSB
requires about 2.5 kHz and FM needs about 15 kHz.

Do you know of any sites or relays in the Central Indiana area? (I'm kind of
new at this so not sure where to look for the info)

Thanks,
Rick N9GSU

Hi David,

That is a good discussion.

I'd add though that there is the possiblity too
that a civilization that "really" (REALLY) wanted
to make themselves known to others in the Galaxy
would transmit a powerful signal detectable easily
by even a 3 or 5 meter dish. They wouldn't make
it hard to detect! They would make it as easy as
possible within reasonable physical limits. One limit
would be power/energy used since they'd not want
to "fry" the local planet or nearby lifeforms for
example ... :-) Beaming a signal makes sense. A
CW tone or tones makes sense. Perhaps a square
wave to get broadband coverage makes sense. A
signal of "sufficient" duration (pulse(s)) makes sense.
Transmitting in the water-hole region makes sense ...

Well, if in fact a signal that was easy to detect was
transmitted then the SETI League approach (when it
reaches fruition) makes great sense! They'll be sure
to make first contact I think.

It is called a "relay facility". What would that mean?

There are now two Russians and one American on board. What language would
you guess they would speak?
Sometimes they talk to NASA ground control, also when over the Russian
coverage area. There is of course a link between the two ground control
facilities (via the normal telephone network I presume) and the audio
can be transferred back and forth.

Furthermore, the Russian communications system is a simple fullduplex
narrowband FM VHF transceiver. Just like one we all have at home for 2M
use, except it operates fullduplex.

The American system is a complex digital thing that multiplexes data, video
and voice on a microwave link that is uplinked to the TDRS satellites.

So, in these days during the initial assembly of the station, the Russian
system came up with the flick of a switch, and the American system needs
more work. It also resides in the American module that is not habitable
because there is not enough power available to heat it. That is why they
are now using the Russian system, accepting the fact that there are
those short "comms passes" in which all info has to be exchanged.

Soon, the American system will be brought online via some temporary cabling
so that they can use it from the Russian part of the system. Maybe that

already happened, I heard them talking about it yesterday.
Later this month, there will be extra solar panels launched to the station,
and the American module can be heated and used.

The crew is now very busy doing all kinds of assembly and cabling work like
this.

In article <8tki1ikit1@gxsn.com>,
From: "Ed Nelson" <ednelson@waitrose.com>

> Possibly it would work, but with any receiver you'll have to tap off the
> final IF output and rectify and amplify it without using blocking
> capacitors - i.e.no audio circuits. That involves taking a soldering iron to
> an expensive piece of kit. I'd be happier doing that in a stand alone
> device, not connected to a PC.

In an SSB configuration, at least in terms of what the circuitry is doing,
one can argue that the final IF is the audio output, and that's basically
how all amateur SETI systems, except those by real radio engineers, get
their signal into the spectrum analysis. (There is a mismatch though, in
that SSB configurations normally have rather narrower filters than those
needed to fully exploit a sound card. It would be interesting to know
whether the WinRadio allows filter bandwidths to be varied independently
of mode.)

If you use sound card bandwidth, and a pure CW signal comes out as a 10kHz
audio tone, one can reasonably say that the final IF is 10kHz. The audio
only really ceases to be another IF when you know what the baseband signal
was supposed to look like and the the receiver is configured to reproduce
that signal.

> CW audio output run into your PC's sound card might do the job at a pinch

I think you mean SSB, although using the names of modulation methods as
labels for the signal processing normally used for them causes confusion
in amateur SETI discussions, because it makes people think you are trying
to detect SSB, whereas the SSB configuration is the right configuration
for AM, FM (low modulation index) and pure beacons, and SSB is not easy
to detect.

> but I wouldn't recomend it. Realy what you need is an unambiguous
> indication of the radio power reaching your feed, and that means measuring

For SETI you need the power in multiple channels that are as narrow as
the receiver stability will allow. That means you must take an audio
(or IF) feed and signal process it. Total power configurations are only
suitable for conventional radio astronomy.

> the voltage at the IF.Also it's imperative that the AGC can be disabled .

AGC is an issue, although one can work around it by keeping the signal
level low (one just needs to dominate the receiver noise). There is
definitely information around on disabling it for ICOM 7600s, but it

gets more difficult on other receivers. A true amateur radio receiver will have circuit details available (although there are a lot of black box operators these days).

The other approach to AGC, for pure SETI, is to totally overload the final stages of the receiver. This is what SETI@Home does. AGC in the S@H (SERENDIP) receiver, will have negligible effect on the work units, because they only contain the sign of the output voltage, not its amplitude. In fact, the total power in S@H work units is always the same!

> secondary in importance. and if you use a cold reference type system, you
> can null out gain drifts, and improve sigan to noise ratio.

SETI uses adjacent channels as the reference (although many people want to know how good their receivers are and do do total power measurments on the Sun for calibration).

> Being boring for a minute, it sounds a fun project, but to maximise
> mankind's (already slim) chances of catching a real live Little Green
> Critter in our lifetimes you might still be more realistic buying a faster
> processor(s) to run S@H!

It is important to understand the limitations of small dishes, and their advantages, but I'd suggest that contributing to the funds of professional researchers would be more effective than buying computing hardware for S@H.

I'd tend to agree that spending this amount of money is unrealistic for most people if the objective is purely amateur SETI, although I'd note that one company that sells war type games to teenagers in the UK, expects to receive GBP 2,000 from each customer during their teenage years.

As a vehicle for learning about electronics, radio, engineering, project management etc. it can be rather different.

Please read the SETI League web site in detail. You will find that a lot of things that you say won't are actually being done, and are often the best choice given the people who are using them.

David,
It is the ICOM IC-R7100 (old) scanner right?
Or the IC-R8500 (new).

Search as R7100 or R8500 on ICOM's web site ...

These receivers are expensive I believe. Another
option would be the Radio Astronomy receivers
build by "Radio Astronomy Supplies" (see the
SETI League web site) ...

Then there's a problem. Horowitz & Sagan (1993) showed that the META results imply no "supercivilizations" in the Milky Way. Specifically, they showed that there are no Kardeshev Type II civilizations transmitting at 1420 MHz in the Milky Way. Now, there are a couple of important qualifiers on that conclusion

* Horowitz & Sagan searched only the northern sky. The southern sky was not searched, so they missed portions of the Milky Way in which potential Type II civs might live.
* They assume that the civilization is transmitting continuously. If the transmission is modulated in time, then H&S could have missed it.

For more details, consult Section 5 of Horowitz & Sagan which should be available online through NASA's ADS.

Here is my recording of an over head pass from this morning around 10am EST
11/4/2000.

It's in RealAudio format and is 704kb. 5 minutes long.

http://www.timhavens.com/n1rz/ISS/iss-1.ra

I copied this using an FT-847 and a moble 2M whip antenna mounted about 2'
from the rig on my bench. Their signal was about +20 to +40db over S9!!!
Almost the entire pass.

There are a few small quiet gaps in the recording lasting only a second or
two...please ignore them ;)

I recorded this using a Video camera, as it was the only thing I had
available to record audio at the time. I converted it to WAV format and
then to a RealAudio format.

Hope you enjoy it.

Tim Havens (N1RZ)

5 min recording as they passed over this morning...in RealAudio 8 format (704kb).

http://www.timhavens.com/n1rz/ISS/iss-1.ra

They were +20 to +40db over S9 on my FT-847 using a Diamond SG7900 mobile antenna sitting on my desktop on my house about 2' from the rig ;-)

AMAZINGLY strong.

I have a 10 minute recording of RS15 going over my location tonight....after I read your post....thought I'd give it a listen.

I wished I'd had an outside preamp on my G5RV but you can definately make out a fair bit of the CW beacon on 29.352.

If you are interested in hearing what I've recorded try this URL but make sure you have RealAudio installed. The 10minute pass is about 1.2Mb in size....but RealAudio streams it out to you....

Give it a try....if you want.....I still haven't decoded the CW at this point...just finished the recording...and I'm about to post it on my website.

Look for the RS15 recording on the following URL:

http://timhavens.com/n1rz/RS15/Rs15-200011051205.ra

PS - the first 5 minutes are kinda lame....then for about 1 minute you can hear my dog come in the room....with RS15 in the foreground still but copy is still pretty good.

Hi Joseph,

I was thinking we were capable (maybe not willing,
but capable) of transmitting CW tones/pulses easily
detectable across the Galaxy by even a small
antenna.

I'll check into this. Maybe I wrong ...

The only thing I'd worry about is the power at short
ranges. It might be hazardous to objects crossing
into the beam (spaceships, satellites, airplanes, ...).
There is probably a maximum acceptable/safe
transmit power, but I'm not sure how to specify
that ...

Nah, unless they luck onto a civ like ours passing through the brief
(in one way or another!) low-tech EM stage. Single-interaction messages
make more sense. A gamma ray could contain an entire message, say by
setting its frequency to the product of selected prime multiples of a
reference frequency derived from the background star. Or complex massless
"particles" could be prepared that would interact with only the appropriate
receiver (you'd then need billions of receivers, one for each message. Might
require a hefty golfball-sized quantum computer).

Given our current technology, maybe listening to seashells is
as likely a detection method as any.

I think the only reason we don't transmit on the hydrogen line is because it is a frequency that has been recognised as one of the best for radio astronomy.

Mir is currently unmanned and latest reports state it will be
de-orbited in February or 2001. However with Mir this kind of news can
change almost daily. 143.625 is the Russian ground control frequency.

I haven't missed it at all. Mir has used that frequency also. You'll
note that you mostly (if not all the time) hear Russian spoken on that
freqency. On the 2 passes I caught today they spoke only Russian. My
bet is they are talking to the Russian ground control. Of coarse they
could be sharing the freqency with Wallops as well.

The Russians use different ground freqencies. Listen to 143.625
when they pass over your area, you'll hear Russian spoken mostly. They
used that freq while on Mir. The Russians don't have the TDRS sat
system like we do.

>During those silence portions, NASA TV commentator would make comments that
>telemetry was being transmitted via the Unity early communications system.

Not sure what that is. Someone?

>If the crew are told not to bother with the radio for the next 80 minutes, I
>am currious as to why anyone in north america would hear convesations as the
>station was over north america ?

Example: Today I caught 2 ISS passes over my area. Both times on
143.625 they were speaking Russian. My guess is they were talking to
Russian ground control or someone at Wallops.

>Or during daytime orbits that go over the USA, would the crew be advised of
>additional communications opportunities ? But aren't they asleep during north
>american daytime ?

According to what I read recently they awaken at 11:00 p.m. ET
However the 2 passes I heard today were morning and early afternoon.
They sleep for 8 hours I believe. So I suppose they hit the sack
around 3 p.m. ET.

>Also, what exactly is the Unity early communications system capable of ? Could
>it handle voice communcations ? Or just telemetry ?

I can't answer that one....

2679. Re: SETI: Why the "Waterhole" Freq, Anyways?

Newsgroup: rec.radio.amateur.space
Date: 2000-11-05 00:00:00 UTC
From: who? <glennt@ibm.net>
Message-ID: <3a051af2_4@news1.prserv.net>
Source record: 8017

Why indeed?

We really don't have any way to reliably guess what medium
another civilization might use to communicate, much less
what frequency. The "water hole" stretches between the
hydrogen line and an OH line somewhat higher in frequency
(10 GHz or so?).

Why look there? The main reason is that there is a minimum
in the background noise there. Lower frequencies have more
crud from various human activities plus increasingly serious
ionospheric effects. The higher frequencies have more
thermal noise and increasing atmospheric absorption. The
"water hole" is a somewhat romantic notion based on the
only (allegedly) civilized society we know of.

It's a bit like the drunk who was crawling around on the
sidewalk under a street light.
A cop asked him, "what you doing?"
He replied, "I'm looking for my wallet."
Cop: "Where did you lose it?"
Drunk: "Middle of the block."
Cop: "Then why are you looking here?"
Drunk: "The light is better."

Like that drunk, we tend to look in the "water hole"
because the light is better!

The picture at the website showing connection to a notebook computer is a clue; that kind of setup is useful for tracking a cellphone user and stealing cellphone id's for subquent sale. Even digital cellphone are vunerable to those kinds of attack, even if the content of the conversation is relatively safe.

Further:

A large dish is the cheapest, simplest way to increase noise rejection and sensitivity: it need not even be moveable, though the aim could be quite easily changed though the main dish axis be fixed. A certain large radio telescope does exactly that. A 5.5 meter fixed, zenith pointing dish suitable for 20 cm to 15 cm wavelengths can be built for three orders of magnitude less than the steerable 5.5 meter transmission dish I described.

If a band were "1000's of MHz wide" it could not be a waterhole, by definition. A waterhole implies a gathering place.

As for LNB LO stability, phase-locked loop LO's in LNB's compare favorably with the WR-1550e frequency stability (+/- 10 ppm.)

In fact, double conversion at the antenna to 70 MHz brings the signal into the range that can be binned with a PCI card spectrum analyzer. The bandwidth filtering is done by the PC. No receiver needed.

So, no, I don't think the WR-1550e would be a good choice for amateur SETI.

EN> <snip>

EN> Can't rememer the details of Kadashev's scheme - something to do
EN> with scale of energy usage I think?

Yes. Kardeshev classified civilizations into three classes
I. Similar to us now, with an energy consumption of 4 x 10^12 W/s
II. A civilization capable of harnessing their star's output, ~ 4 x
10^26 W/s
III. A civilization capable of harnessing their galaxy's output, ~ 4 x
10^37 W/s.

Horowitz & Sagan argue for a re-classification. We should be Type 0
and Type I should be a civilization capable of harnessing all of a
star's incident radiation on their planet.

AAA> I'll check into this. Maybe I wrong ...

Even if we are capable, though Horowitz & Sagan's result is slightly
different. They can find no evidence that anybody *is* doing it (with
the caveats in my original message). Moreover, Horowitz & Sagan used
a much larger antenna (either 12 or 25 m).

The e versions won't work without a PC. The PC provides the front panel.

> stealing cellphone id's for subquent sale. Even digital cellphone are

You'd almost certainly want the internal version with DSP for that, and,
even then, I don't think any of the supported modes would handle GSM,
and virtually certain that none would support TDMA. I'm not even
sure that any of the modes would work well for TACS signalling.
Almost certainly, the best technical solution for the sort of fraud
you are describing would involve the use of standard cellualar phone
chip sets or obsolete phones.++

(Note that the GSM specification has measures for protecting the
phone identity, although it is sometimes necessary to send the true
identity in clear, and what I know is from reading the specifications
some 10+ years ago, not what is the situation as actually implemented.)

I quite accept that most non-professional purchasers of this equipment
will be using it for questionable, and in some jurisdictions,
illegal purposes, but I would suspect most of them will simply be
violating equivalents of the UK Wireless Telegraphy Act, or various
communications privacy acts, for prurient purposes, rather than for
financial gain. This is equally true of UK purchasers of Radio Shack
scanners. (If I understand the US position correctly, it is illegal
to sell equipment that can monitor cellular frequencies, but it is not
illegal to listen to anything on equipment that is legal to sell. In the
UK, about the only things that one can legally receive are legitimate
broadcast stations, standard frequency services, and amateur radio
operators, although you need a licence for broadcast TV. (GPS is de
facto, and probably de jure legal, and citizens' band may be.))

Incidentally, I expect professional users to use the 3xxx models, so
I'd say that the 1550 is definitely aimed at the amateur scanning
market.

> A large dish is the cheapest, simplest way to increase noise rejection and
> sensitivity: it need not even be moveable, though the aim could be quite

True. But 3m dishes cost virtually nothing beyond the shipping costs,
if you use redundant ones, as most amateurs do, and even 3m dishes can

cause problems with planning control authorities.

> If a band were "1000's of MHz wide" it could not be a waterhole, by

There are three definitions of water hole; your definition is the one
that has least scientific credibility and was invented more for PR
purposes - it tends to make people think that 1.42GHz is the only place
to look.

The other definitions are:

- the approximate 200 MHz between hydrogen and hydroxyl lines - this
approximates to the original coverage aims of project SERENDIP (from
which S@H data is taken) - the current coverage is less;

- the several thousand MHz range up to the point where water vapour
in the atmosphere makes it effectively opaque, down to the point where
galactic noise dominates - although Phoenix doesn't cover all this range,
it attempts to do so in as much as it goes well beyond the 200MHz range.

Arecibo planetary radar, which is arguably our most detectable signal,
only matches the final category.

See: <http://www.setileague.org/general/waterhol.htm>

> In fact, double conversion at the antenna to 70 MHz brings the signal into
> the range that can be binned with a PCI card spectrum analyzer. The

There's an article in Radio Communications (the RSGB magazine, in the
Technical Topics section, about a pure DSP HF receiver design by the UK
Defence Research Agency. The author of that column sources material
from technical publications - it's not a vehicle for press releases -
so I'd take it that building a receiver going up to 30MHz with good
dynamic range represents the state of the art. (You can probably run a
fast DSP on a hydrogen line receiver if you have good RF filtering to
suppress satellite based transmissions - note that the professional,
SERENDIP, system is unable to completely suppress these.)

> bandwidth filtering is done by the PC. No receiver needed.

This is all professional equipment. Some amateur SETI is done by people
who work professionally in radio design, and they tend to use special
purpose hardware designs, but much of it is done by people who have
little technical awareness. If they want a system just for hydrogen line
SETI, even they might be better off with specialised receivers, but
they'd almost certainly have to write off the whole cost, because of the
lack of second hand market, and they'd only be able to test it using
radio astronomy sources.

Also, as I pointed out before, cable losses are tolerable and can be
compensated with an LNA, so even home constructed receiver systems
place the first downconvertor at the bottom of the downfeed. Ku
band TVRO frequencies suffer much greater cable losses, so,

combined with other things, it makes sense to downconvert at the feed point.

> So, no, I don't think the WR-1550e would be a good choice for amateur SETI.

None of your criticisms seem to differentiate it from the ICOM 7100 (hope I have the correct number this time) that is the de facto standard receiver for black box amateur SETI, and probably for some amateur radio astronomy. The ICOM has a hardware front panel, but is still computer controlled and can, I think, be operated as though it had only a software front panel. (The questioner was actually thinking of another brand of similar receiver.)

The main criticism of the WinRadio, from my point of view, is that the web site, at least, does not provide technical information about the structure, let alone the circuitry, of the RF side of receiver. This may well be true of the ICOM. However, a look at the links on the site, and the fact that one of the WinRadio staff has a link from the SETI League members' home pages page, makes me think that they'd be prepared to provide some technical information (e.g. disabling AGC) in order to attract the amateur SETI market).

(It's fairly clear that Dr Shuch, who heads the SETI League, uses specialised designs, but he has to consider that many people are entering amateur SETI without an RF engineering background, and who might well get bored and risk being left with a white elephant. He therefore has to produce designs for black box users as well as those with an RF design background.

A lot of the technical side of amateur radio is about innovative use of redundant or general purpose equipement, to keep costs to an absolute minimum.)

Apart from age, location, approximate budget and an interest in SETI, we don't actually know much about "bookvous". Whether they should even be trying or the best solution for them almost certainly depends on things we don't know. (If they are interested in an academic career in this area, they should be thinking in terms of learning mathematics, and physics. A university interviewer (or even a job interviewer) is probably not going to be interested in the technical content of a project like this, but rather how they planned, researched, documented and executed it, and how well they can explain its purpose and operation to someone without relevant technical background (or who pretends not to have it) i.e. project management, communication and learning skills.)

++ I.e. the use of this equipment for cellular fraud would, if anything, be rather more of a bad technical choice than its use for SETI. In fact, I'd say it would be a very bad technical choice.

2692. boom material for vhf/uhf mounting on az/el rotor?

Newsgroup: rec.radio.amateur.space

I am putting a azimuth/elevation rotor on the top of my tower for uhf and vhf freqs. They will be mounted in typical 'H' configuration, one antenna on each side of rotor. What material do you all use for the cross boom through the rotor? I am up 40', and it can be breezy. Antenna for each band is abt 13' long yagi. Instructions for antenna recommend not using metal due to detuning the antenna. Thanks! -Gerry

Joseph,
I think the caveats are very important. I have a copy of the article
by Horowitz & Sagan (1993), The Astrophysical Journal,
415:218-235, 1993 September 20. It is very interesting. I have
read through Section 5, but I don't believe the claim "no
supercivilizations in the Milky Way".

What is the real probability of signal detection for the META
project? Please hear me out and tell me where I'm wrong:

(1) The Harvard radio telescope has about a 0.5 degree
beamwidth at 1.420 GHz. Hence the probability of that
beam pointing at the right place in the sky is:
P1 = delta_phi * (1 - cos(delta_theta)) / (4*PI).
If we assume delta_phi and delta_theta are each 0.5 degrees
(convert to radians) then is:

P1 = 2.6E-08

(2) It takes META one year to cover the sky from (-30 DEC
to +60 DEC). If the signal from the supercivilization is pointed
at us directly for (say) 30 minutes then the probability that we'll
look at the right time is:

P2 = 30 / (365*24*60) = 5.7E-05

(3) META does narrow FFT's (0.05 Hz binwidths) and it is
capable of covering a 400KHz band. If the signal can be
anywhere in the 10GHz region where the radio noise is minimal
then the probability of detecting the right frequency is:

P3 = 400KHz / 10GHz = 4.0E-05

(4) The overall probability then for META to detect at the right
spot in the sky, at the right time, and at the right frequency is:

P4 = P1*P2*P3 = 5.9E-17

This is a very grim chances. So thinking this, I don't see where
Horowitz & Sagan (1993) can make the claim:
"no supercivilizations"!

Where have I gone wrong?
Al

PS: I do think it is very odd that there seems (seems!!) to be no
evidence of super technology "out there" from all our observations

of the Galaxy and Universe (except perhaps for the Universe it
self!). I don't think we are anywhere near close to proving they
are not out there though!

We are already sending accidental signals (doppler radar on asteroids)
that are detectable at 10s of light years using 3m dishes. These are
precisely the sort of short duration, single event, signal, where
the Argus strategy would work well. Increasing the power by 100 times
is well within what is imaginable, and could probably be done now with
the right political will. That would increase the candidate stars
by a factor of around 31, but the number in range is already getting
large enough to be statistically well behaved.

You don't need star killing powers to be deteced by amateur systems.

On the other hand, if your star is dying, and you don't have interstellar
spaceflight, you might be prepared to use extreme amount of power to
preserve your culture.

I think this was a question of someone not understanding the structure
of the observable universe and using galaxy in a loose sense. They
probably meant solar system. People have trouble with the idea of how
large the galaxy is.

> Most amateur systems will have great difficulty picking up probe signals
> originating inside our *solar system*. Picking up ET's signals from distant

The 1.3 watt omni-directional beacon on Mars Global Surveyor was
detectable at 5,000,000 km, even though the receive antenna was less
effective than a 3m dish and the frequency used is about 9 times more
noisy than 1.42GHz. See <http://www.setileague.org/articles/mgstest.htm>.
That's about the same power as a digital mobile phone in a fringe area,
and much less than the EIRP of a normal telemetry channel.

> You have to postulate truly enormous ERP on the part of ET to have any
> possibility of receiving signals from outside our solar system. That's a

You only have to postulate the levels of power that Arecibo is already
using for doppler radar on asteroids.

See <http://www.setileague.org/software/linkanal.xls> for a spread sheet
to work out ranges under various assumptions; Arecibo has at least 1MW
of feed power and is approximately 1000 feet across; the radar frequency
is somewhere around 4GHz.

> major engineering challenge for anyone, and unnecessary for any ordinary
> purpose. Perhaps that's why we haven't heard anything.

One argument is that we have "heard" asteroid tracking radars, but they
present as one off events and have therefore never been confirmed.

> you can't hear Mars Observer, Galileo at Jupiter, or Voyager and Pioneer
> near the edge of the heliopause, you probably can't hear anything likely to
> be in operation outside of our solar system either.

I believe that Voyager/Pioneer are on the limits of detectability for
project Phoenix at Arecibo, and below the intensity of Arecibo CW radar at
nearby stars, which is detectable by 3m dishes.

The Big Ear system that detected the Wow! event is less sensitive to narrow band signals than current 3m amateur SETI systems, see:

As a VE I once tested an OT who had first been licensed in 1926 and had worked several years as a Maritime radio operator. When he hobbled with his cane into the VE session at age 80, I knew him because I had known him when I was a kid. He was the ham who had Elmered my Elmer in 1928 - **60 years** ago, at that time. He had long ago allowed his ticket to expire, and decided to get back on the air again in his declining years. He took the 20wpm code test right off, and turned in a perfect copy. He quickly completed all the elements for Novice, General and Advanced. I then asked him if he wanted to try the Extra. There had been no Extra when he last held a license. He took the test back to his seat, spent a few minutes looking it over, then brought it back with the comment that he thought he'd better study a little before taking that one, it had some new stuff on it. Next session he was back, and aced the Extra written. He spent the next several years working CW on 20 meters, and sadly, became SK a few months ago.

That's the sort of ham you say won't be any more qualified than a post-April 2000 Extra lite. As usual you're full of stinky stuff.

But Dick, that *very same OT* would be condemned by you if he
took all the exams now. That makes you a rather despicable
character, IMO. How could that very same person be less qualified
because he took his exams now instead of whenever it was. Why
would you admire one 80 year old OT and despise another just
because they took their exams at a different time?

We agree here, too. We have just started to scratch at parameter
space. Nonetheless, the META search is an important constraint on the
possibility of supercivs in the Milky Way.

The independent variables are space, time, and frequency. If you look at all space at once then P1 = 1 (as the SETI League is trying to achieve to cut down the odds). Even if you look at all the sky at once you still have the time factor (how long to look) to worry about. How long to look depends on how many civilizations are out there "pinging" away, the duration of the "ping", the time it takes their beam to sweep past the Earth, and the repetition rate (when will they come back to ping the Earth again).

META did not look at all the sky at once. It takes one year to cover the sky. There were(are) plenty of opportunities to miss a signal momentarily directed at Earth.

I think assuming a continuous transmission directly to Earth is being too optimistic. To assume continuous transmission and then deduce on a negative result that there are "no supercivilizations" out there is just wrong.

Think about that transmission in 1974(?) from Arecibo to the star cluster M13. The transmission (an actual digital message) lasted 3 minutes (if I remember correctly). M13 is 24,000 LY's away. It will take that message 24,000 years to reach M13. What do you think the odds are of detecting that 3 minute message by some advanced civilization in M13? They are very poor. They'd need to look an awfully long time. We did not even repeat the message! It has been 26 years (or so) now! (I think The SETI Institute "ought" to consider repeating that transmission!).

I wouldn't start off assuming continuous extremely high power omni
transmission. I would treat it as a special case perhaps, certainly not
the only case ...

Yes, it depends on the assumptions, but still it is something like 10^(-5)
in the best case ...

>
> AAA> PS: I do think it is very odd that there seems (seems!!) to be no
> AAA> evidence of super technology "out there" from all our

>
> We agree here, too. We have just started to scratch at parameter
> space. Nonetheless, the META search is an important constraint on the
> possibility of supercivs in the Milky Way.

Yes, I agree with that. I didn't mean to 'hammer' on META. I just want to
understand the scope of the problem. Come to grips with it.

In fact as a member of the Planetary Society I support getting the Harvard
radio telescope up and going again ...

I think that OSETI (at Harvard, and Princeton now too, and UCB) and looking for nanosecond laser pulses is important too ... These type pulses, like narrowband signals, are not natural to the Universe, and if detected (and they repeated) they would be a sign of interesting activities ...

Al

PS: The other assumption (probability) I made was a beamed transmission with enough power to be detectable by a small antenna. I assumed that this probability was essentially 1 as the small antenna would detect it (have
enough SNR). Big antennas aren't needed then. I thought this was a reasonable assumption. Only thing to worry about is that there might be so much power needed that it would be too dangerous to do (for lifeforms as we know them). The transmit power might kill everything near to the transmitter, even many light years away.

I recall that Telsa first detected radio "whistlers". He thought these were alien signals. So he built a huge induction coil to better study the phenomena (late 1800's or early 1900's). Something like that
(I don't remember the exact details). Made everyones hair stand on end for miles around ... :)

PPS: I wonder how close we could get to a pulsar? It seems it would be very risky even many light years away ...

The Early Communications (Ecomm) system is a TDRS link for telemetry only.
It
doesn't support voice comm. Hence the reliance on the VHF frequencies. If
I
find a link with some of the specifics of the Ecomm system I'll post it.

>
>>Or during daytime orbits that go over the USA, would the crew be advised

I'm not positive about the crew, but I know that the NASA VHF stations are
aware of
all passes for the ISS. The Russians are also aware of all of these North
American
passes. If there's a problem on board, the crew will be awake and will need
to
communicate.

With the manning of the International Space Station has come new activity on the Russian Space Programs VHF downlink frequency, 143.625. NASA has tracking stations on both coasts to talk with the ISS when they pass over these sites. Keep track of the station via a tracking program with the latest kep elements for ISS or the NASA channel and monitor 143.625. You will hear russian language downlink when they pass over. I was able to monitor a horizon to horizon pass at my QTH in the northwest with a discone antenna and my BC230XLT handheld scanner. If you monitor and watch the NASA channel you can get a translation of the conversation. Also listen for Amateur Radio activity starting in the near future on 145.800. Have fun monitoring, Scott, KA7FVV

Unlikely that amateur radio activity will start very soon, given the fact
that they complain about the high workload setting up essential systems
right now. Wait until after the next cargo shipment and shuttle visit,
I think.

Could be, but according to Saturday's NASA ISS bulletin they were given yesterday off. Seems like a good time to monitor 145.800. I also understand they are sleeping and working on UTC time.

Yeah I just found Predict and it seems to do accurate predictions,
though I wonder if you can add other sats and not just amateur sats since I
dont
work amateur sats, and a graphical (svgalib) client would be nicer, but I
guess
Predict will have to do.
But what I miss is a function to load a keplar file and use the sats in
that one
directly, I dont want to have to type in every entry manually.
Thanks for the url too

Predict will track any satellite you tell it to. The docs say
what you need to do. If you don't like how it does it, change
it. It's open source, after all...

If you want a graphical display, predict provides the hooks
to roll your own. Look in the documentation about "server mode".
There is a cute X Windows-based graphical display program
available that uses predict's UDP socket. A client for svgalib
would be straightforward.

It needs a patch for Y2K (from my homepage) and the correct settings
in the Makefile. The latter depends on the layout of your system.

I am using SuSE Linux. It looks like Debian provides a package with
presumably the correct Makefile (but without the Y2K patch!)

Once the station has been set up, such days off are a good moment to
listen. I just doubt that they will spend their time off doing exactly the
same thing (locating cables, finding the place to plug them in) they have
been doing all week long...

I have heard the 2m will NOT be up before the 14th at the earliest, one would imagine it has very much less priority than the mission itself :-).

I saw the thread about non-x sattrackers, but are there any really good satelite tracking programs for Linux with X, preferably using OpenGL for graphics?

David

When I checked (well into this year) it didn't, but apparently it has been
updated. Good.

2721. FTP file "pool" for ISS recordings at eavesdroppers

Newsgroup: rec.radio.amateur.space
Date: 2000-11-07 00:00:00 UTC
From: Eavesdropper <ian@eavesdropper.worldonline.co.uk>
Message-ID: <3a08841d@news.server.worldonline.co.uk>
Source record: 7908

WWW.EAVSDROPPER.DABSOL.CO.UK

I have setup a page where you can all upload your recordings of the ISS to share together, we have 100MB currently avaliable for REAL MEDIA FILE FORMATS ONLY.

Go to the above site and access the ISS comms/voice recordings page and PLEASE read it through in full especially taking note on how to name your files before upload to make sure it stays organised and clear for all.

When I have completed my house move I will try to organise a more sophisticated method of upload and display that will be more dynamic but for now this will help us share ourfinds and be usefull for worldwide monitoring.

many thanks

ian koenig

People keep talking about "decent", and now "really good" programs.
All the programs I have ever used present accurate information
in a variety of useful ways, both text-based and graphical.
The better ones provide hooks for further development.

What more do you want?

Well, I uploaded the fixed package for Debian on January 3. It would have
propagated to Debian mirrors etc by about January 5.

73,
Hamish

>strong suits!

But you will have to do that... No "make config" or "./configure" in this
case.

You will see that most sections are repeated multiple times.
You need to remove the comment (#) signs on one section, like this:

```
# i386 (i386 with Linux)
#
CPU = i386/Linux
CC_CMACH = -O -DIOCTL
CC_LMACH =
CC = gcc

CC_CUSR = -DHOMEDIR -DREVERSEVIDEO -DSUNTRANSITS -DXWINDOW

X11 = /usr/include/X11

LX11 = -L/usr/X11R6/lib -lX11 -lXt -lICE -lSM # X11R6

CC_CXINC = -I$(X11)

CC_LXINC = $(LX11)
```

(the above are the selections I made in those sections where alternatives
are available in the Makefile. This should work with SuSE)

#1 - VERY BRIEF INTRODUCTION

Due to an enormous client list, I can only take serious applicants at this time. I am offering a full or part-time position in processing e-mail. You can work at home. I do require that you have a computer and are familiar with internet/e-mail functions. As to the salary it's totally up to you. You will be running your own business, the sky is the limit. What you will see represents a totally legal money making business that anyone can generate a significant residual income.

You will receive full instructions, and I will always be available to help you and answer your questions. This is a genuine home business. This is not a chain letter, money game, telecom scheme, or any of the multitudes of dubious "business" offers that come through your e-mail box. This business will generate a residual income of $2,000 to $6,000 every month with only part-time commitment (about 10 hours a week).

A full time commitment (about 30 hours a week) based on statistics gathered from associates world wide, will translate into an income of $10,000 or more per month!

To prove my confidence and sincerity in this opportunity, there is NO CHARGE to join us for the first month. You will receive all information to get started plus the first month's information package ($90 value). If by remote chance you are not satisfied with the program after the first month and want to discontinue, you may by all means do so and I will not contact you again.

But on the other hand, if you are satisfied with the program and wish to continue after the first month, that is when you have to pay $90 for the next month's information package. Since you DO NOT pay anything until after you are already earning an incredible residual income, you have absolutely nothing to lose.

IMPORTANT!

If the above opportunity interests you in the least, and you would like more specific information about our business please contact me at adenby@consultant.com and type in the SUBJECT LINE: "FORWARD PROJECT 21 INFO". Insert your full name, your correct e-mail address, and any specific questions you may have at this time in the body of the message.

We are successful only if YOU are successful, and therefore we will do everything in our power to ensure that your relationship with us is a profitable and successful one. I look forward to your response.

Sincerely,
Angela Denby

2729. FS: TimeStep Weather Satellite Receiving Station

Newsgroup: rec.radio.amateur.space
Date: 2000-11-08 00:00:00 UTC
From: Rick & Gaye <rgdye@quik.com>
Message-ID: <4vjO5.202$%3.100720@newsfeed.intelenet.net>
Source record: 7915

For Sale or Trade TimeStep Weather Receiving Satellite Station. This station is fully automated and will receive Meteosat/GOES, NOAA/Meteor/Okean Polar APT and any other APT or GOES satellite they may put into service. This station has the following equipment. TimeStep SCANNING WEATHER SATELLITE RECEIVER 4.1, TimeStep 1691 MHz METEOSAT/GOES RECEIVER, TimeStep 1691 MHz PREAMP & FEED, TimeStep PROsat for WINDOWS i INTERFACE with SOFTWEAR, TimeStep 137 MHz MASTMOUNT PREAMP, 3 FOOT MESH DISH for 1691 MHz and a Antennaco CY137-2 Crossed Dipole for 137 MHz. Station comes with all cables, power supply, all options and boxes. All you need is 75 ohm or 50 ohm feed line for the two antennas. I bought the station 6 1/2 months ago and it is in like new condition. I paid over $2040 + shipping. I will trade for late model HF or VHF/UHF radios. Like late model FT-847 or ??. I will take any combo, cash radio or sale outright for $1450 + shipping. I will take VISA through X.com's PayPal. I will supply buyer with warrenty info and invoices. I have pics of the station if you want to see them. If you need more info on TimeStep equipment go to www.time-step.com If you need info on PayPal go to www.paypal.com I am an airline pilot so you may catch me on my cell phone at 859-492-9203 or email me. I will supply home number after contacting me via cell phone or email first. Don't want the home number going around the world. Tnxs de AC4VM

Radio Meteor Observation Bulletin No. 87 November 2000

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Paseo Bonanova, 8 Barcelona (02 07'E, 41 24' N)
Frequency: 48.24715 MHz.
Transmitter Location: Biedenkopf C2 TV, Video Frequency 48.250 MHz,
ERP 100 kW, Azimuth 90 +/-65
Antenna: 3 element Yagi Azimuth 200 deg (NE), elevation 20 deg
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (500 Hz) and fed into the PC in real time.
Data sampling system: own written software "MSD" with sound card.

Note:
My future projects in meteor detection are:
* complete special receiver (student project, will finish in March 2001)
* change the MSD from CVI language to visual C or Delphi (end 2001)
* get more information with the new MSD (meteor speed, density etc. end 2001)
* interactive WEB meteor detection (end 2001), every one can hear the reflections
in real-time via Internet. Also on can choose some statistics about the reflections.
* put on a new antenna array at the new observatory location (middle or end 2002).

Enric Fraile Algeciras

Observer: Jean-Louis Aillaud

Location: Sainte Clotilde, R&#65533;union Island (55 29' E, 20 52' S)
Frequency: 87.7 MHz, 89.7 MHz (empty frequency for coincidence)
Transmitter location: Madagascar - 850 Km
Antenna : 3 elements Yagi FM horizontal polarisation
elevation 90 deg (zenith), astronomical azimuth: 114 deg (=West)
Receiver 1: FM tuner Technics ST G 450 L (on 87.7 MHz)
Receiver 2: FM tuner TEAC TR 400 (on 89.7 MHz)
observing method: Electronic interface on LINE output audio signal are fed in
COM2: of PC (1) 100 MHz and COM2: of PC (2) 200 MHz
METEOR V4.0 processes the signal and records on hard disk the time
of the events.
METEOR parameters: threshold 10 for 87.7 89.7 MHz
COLORGRAMME V.2 for examined DATA and generates RMOB bulletin
automatically
COLORGRAMME parameters: sum freq 3000

Jean-Louis Aillaud

Observer: Michael Boschat
Location: Halifax, Canada (63 36'W, 44 39'N, 58 meters above sea level)
Listening Frequency: 83.24 MHz
Receiver: Icom R-10
Antenna : resonant dipole
Antenna Direction: Horizontally polarized with lobes in E-W plane, elev 0 deg
Filter : high-Q (Q at least 300) bandpass filter between antenna & receiver.
Listening Mode: CW
Recording method: listening by ear

Notes:
. no corrections for radiant position made to the counts
. - = no observations made
. * = Interference

Mike Boschat

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi (x form), 4 elements, astronomical azimuth 270 deg (= E), elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal generator. Sensitivity: 5 muV (modulation frequency 1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB.
SWR of antenna alone at 66.5 MHz: 1.4/1 (good to very good), measured with MFJ/259P SWR analyzer (HF-VHF 1.8 MHz to 170 MHz)

on Sep 28, 1998.
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the Ghent University format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

October 2000

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

```

Notes:
. ? probably affected by sporadic-E, tropo, direct reception.
. * warning for relative high number of long duration reflections,
an indication for potential stream activity.
. local time = UT + 2 hours
change to winter hour on Oct 29, 2h UT (local time = UT + 1 hour)
. changed trigger level to 20 AD counts starting Oct 2000 (previously
6 AD counts since the start of the observations in 1993).
As expected this setup is less sensitive to (low volume) interference.

Maurice De Meyere

Location: Astronomical Observatory, Ghent University, Belgium
(ED50 coordinates: 3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation 20 deg
Antenna amplifier: 10 dB gain
narrow band resonance lambda/4 antenna filter
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

```

Note:
. nothing special to mention, besides the fact that the first autumn
storm downed the antenna on the roof of university building S9
on Oct 30 between 7 and 8 h UT.

Pierre De Groote

Observer: Rafael Haag
Location: Porto Alegre - Brazil (51 15' W, 30 10' S)
Frequency: 89.9 MHz
Receiver: Home made transverter plus narrow band FM(ICV-68) (B=15 kHz)
detected signal level >-125 dBm.
FM detection, no pulse noise rejection required.
Antenna: 2-el. Yagi, 6 meters high, azimuth 200 deg, polarisation V,

elevation: 30 deg
Data sampling system: PC 286. Software same Ilkka Yrjola, threshold triggering.
Computer logs total hourly elapsed reflection time, number of
triggers for the hour, the longest time the signal was
continuously above detection level for the hour.

Observer: Sadao Okamoto
Location: Damine Meteor Observatory, Japan (137.53 E, 35.07 N)
Transmitter: HAM beacon (JA9YDB) for RMO (50 W CW, 53.7500 MHz) by
JA9BOH Kimio Maegawa. No modulation except for identification.
Antenna: 2 element Cross Yagi 4 dBi aiming to Zenith. Omni-directional
in azimuth and elevation above 15 deg elevation.
Location: Fukui-NCT at Sabae city (136.2 E, 35.9 N)
At present time about 10 observers are listing for
Kimio Maegawa's 53.75 MHz beacon.
Receiver: IC575
Antenna: 2 element Yagi, pointed to the zenith.
Observing method: FFTDSP software, manual count.

Hourly echoes over 10 dB SNR

Notes:
. Giacobinids activity could not clearly be observed.
. The maximum of the Orionids activity was best observed in the long echoes
on 22th October.
-: lost counts because of high noise level or machine failure.
@: Hourly rate estimated by effective observation time less than 60 min.
n: Contamination due to radio noise or interference
e: Contamination due to sporadic E opening
f: No data available due to TX or RX failure
JST = UT + 9 h

Sadao Okamoto

Observer: Ton Schoenmaker
Location: Roden, Netherlands (06 26' E, 53 08' N)
Frequency: 55.275 MHz
Transmitter: Spanish TV channel E3 (video); transmitters in La Muela (30 kW),
Gamoniteiro (50 kW) and Aitana (60 kW); all stations within
100 Hz of nominal frequency; distance ~ 1500 km
Antenna: 3-elements horizontal Cushcraft 50 MHz Yagi tuned to 55.3 MHz;
geographical azimuth 210 degrees (SW)
Receiver: Yupiteru MVT-9000 in USB mode; sensitivity 0.5 uV at 12 dB S/N
Observing: 800 Hz audio signal from ear-phone socket was rectified, digitised
and fed into a PC via the parallel computer port. HP VEE was used
to process the digitised signal and to store 15-minutes counts of
reflections stronger than 0.22 uV (-120 dBm). Also for all
individual meteors date, time, duration (dead time) and maximum
signal are stored.

Uncorrected hourly counts for signals stronger than 0.22 uV

Notes:
. - no observations
. * affected by ionospheric or tropospheric propagation

Ton Schoenmaker

Observer: Dave Swan
Location: Christchurch UK (50.47 N 1.44 W)
Receiver: Pro 2006 (modified to give a carrier detected
output for Chessell 301 pen recorder).
Sensitivity NFM: 0.5 uV (S+N)/N = 20 dB Dev: 3 kHz
at 1 kHz BW 9 kHz. Calibrated: 1/05/00
Antenna: 4 element Yagi broadband design for 50-70 MHz Gain 9.2 dBi.
Azimuth 95deg elevation 8 deg. Two 3 stage constant K
filters fitted after the antenna, (High and Low pass)
to reduce out of band interference and
intermodulation products causing spurious meteor counts.
Frequency: 66.62 MHz
Transmitter: Budapest 100 kW 24 hrs
Computer: Olivetti 386 Notebook with Meteor v 4.0 software

Observer: Garfield Tsao (BM2EQB)
Location: LonTan Observatory

LonTan, TauYan, Taiwan R.O.C. (121 14'37" E, 24 52'54" N by GPS)
Frequency: 50.0169 MHz USB mode 3 kHz width.
Antenna: Comet made 50 MHz Yagi HB 4 element (gain 10.3 dBi)
astronomical azimuth 225 deg (=NE), elevation 7 deg.
Transmitter: MIYAZAKI University Japan, USB mode, 50 W (24 hours),
distance about 1225 km from Lon Tan.
Receiver: Icon PCR-1000 computer controlled all band receiver
Sensitivity: 0.25 uV for 10 dB S/N for USB mode
Observing method: the beacon 920 Hz voice signal (by FFTDSP) is
received by a low frequency filter (900 Hz)and fed into
the D/A converter and computer in real time.
Data sampling system: using an 8 bits A/D card to PC/AT and Qbasic program
with 1/8 second sampling interval to store the> 1.0 s reflections.

October strong and long lasting echoes list

LT strength duration
dBi s
Oct 21 02h40m > 120
07h15m > 60
29 00h11m > 20
03h07m > 20
03h27m > 20
03h38m > 20
05h00m > 20

Notes:
. "E" = weak E layer
. "I" = background noise interference affected the normal echoes

. this month, there were less total echoes and long lasting echoes
than during the same month of last year.

Garfield Tsao

Observer: Ilkka Yrj&#65533;l&#65533;
Location: Finland (26 35' E, 60 54' N)
Frequency: 88.7 + 88.8 MHz
Receiver: Salora SRP-22 modified, narrow band FM (B=15 kHz)?
detected signal level >-122 dBm.
FM detection, no pulse noise rejection required.
Antenna: 2-el. Yagi, G=4 dBd to SW, azimuth 45 deg (SW), polarisation H.
Data sampling system: threshold triggering, sampling rate 32 ms.
Computer logs total hourly elapsed reflection time, number of
triggers for the hour, the longest time the signal was
continuously above detection level for the hour.
Data on major showers available in the Compact MS-Soft format.
Software for viewing available from

21	338	86	40	
22	119	168	173	
23	107	148	182	144
UT	18 Oct	19 Oct	20 Oct	21 Oct

Note:
. Since an Estonian local radio came on the air just before the Orionids peak (Oct 16) on the better FM band frequency wiping out the channel with strong signals (88.8 MHz), the data is taken only from the weaker channel and seems to be not
scaled too well (loo low), and it suffered from short periods of tropo.
Since I have been forced to change the setup again, I do not have much motivation
to re-scaling just Orionids data, because of the temporary nature of the situation
during Orionids. I do not know on any outburst from this year's Orionids and suspect it behaved in normal fashion.

Ilkka Yrj�l�

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

For more information see
http://www.flatoday.com/space/explore/stories/2000b/110500d.htm - the
Unity early communications system uses TDRSS and can transmit
telemetry or low-quality audio/video but not both at the same time.

After 5A (or thereabouts) they'll be able to activate a newer antenna
which went up in 3A and is mounted on the Z-1 truss. This will
provide higher bandwidth communications via TDRSS.

2733. Re: SatTrak won't compile

Newsgroup: rec.radio.amateur.space
Date: 2000-11-08 01:05:18 UTC
From: Jim Jerzycke <kq6ea@amsat.org>
Message-ID: <3A08A6CE.8B368C85@amsat.org>
Source record: 7909

Well, I'm running SuSE 6.4 on one machine, and 7.0 on another. I haven't
(tried to!) compiled it quite a while so I don't recall the error msgs,
but the hint about the makefile is probably where the problem is.
Would "make config" then "make" followed by "make install" work? I've
tried this on other progs that were reluctant to compile and it worked.
I REALLY don't feel like hand editing a makefile.....NOT one of my
strong suits!
TIA, Jim KQ6EA

No. There are no such targets in the makefile.

I had no problem with mine: tell it which system to compile for,
tell it what components to include, and tell it where the X
files are.

> I REALLY don't feel like hand editing a makefile.....NOT one of my

That's how you do it with this program. Sorry. The edits
are really pretty minor: just uncommenting some lines and
commenting others out.

How about we all just monitor the Frequency and then when we hear something we post it instead of arguing about when the best time to listen is. You listen when you can!

It is only useful to listen when the station is both above your horizon and
visible to one of the wellknown groundstations. When it isn't, it simply
won't transmit.

I can hear the station before it becomes visible to the Soviet stations,
and I can hear them switch on right at the moment when the groundstation
knows (from their orbit calculations) they become in range, and call them.

Good luck... it is not that difficult but you should be a bit persistant.
The earlier versions were much trickier because he used a different
make utility with complicated makefiles that GNU Make would not parse
correctly... maybe your tries are from that era.

You could also send a mail to SuSE support asking them to include an rpm in
a future release. There are several Ham Radio rpm's on SuSE CD's, and when
even Debian includes it on their distribution there should be no problem at
all with any distribution limitations :-)

I used that code to make a rotor controller interface for
my club stations 2m/70cm antenna array. So now Predict controls
our antenna system.. Took me about 30 minutes of coding or so..

The protocol could be improved, and perhaps I'll do that
one day.. I'd also like to be able to get the Sun and Moon
data out on the socket for EME-tracking.

Subject: $6 Deal=20

Date: 10-01-2000=20

Poster: Railsplitter

Message=20

A while back, I was browsing these newsgroups, just like you are now,=20
and came across an article similar to this that said you could make=20
thousands of CASH within weeks with only an initial investment of=20
$6.00 plus stamps! So I thought, "Yeah, right, this must be a scam!"=20
But like most of us I was curious and kept reading. It said that if=20
you send $1.00 to each of the 6 names and addresses listed in the=20
article, you could make thousands in a very short period of time. You=20
then place your own name and address at the bottom of the list at #6,=20
and post the article to at least 300 newsgroups. (There are about=20
32,000 of them out there and that's quite a large market pool). No=20
catch, that was it. Even though the investment was a measly $6, I had=20
three questions that needed to be answered before I could get involved=20
in this sort of thing.=20
1. IS THIS REALLY LEGAL?=20
I called a lawyer first. The lawyer was a little sceptical that I would=20

actually make any CASH but he said it WAS LEGAL if I wanted to try it.=20
I told him it sounded a lot like a chain letter but the details of the=20
system (SEE BELOW) actually made it a legitimate legal business.=20
2. IS OK WITH THE POST OFFICE OR IS IT MAIL FRAUD? I called them:=20
1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See 18,=20
h sections1302 NS 1341 of Postal Lottery Laws). This clarifies the=20
program of collecting names and addresses for a mailing list.=20
3. IS IT RIGHT? Well, everyone who sends me a buck has a good chance of=20
getting A LOT of CASH ... a much better chance than buying a lottery=20
ticket!!!=20
So, having these questions answered, I invested EXACTLY $7.92 ... six=20
$1.00 bills and six 32 cent postage stamps ... and boy am I glad I did!=20
Within 7 days, I started getting CASH in the mail! I was shocked! I=20
figured it would end soon and didn't give it another thought. But the=20
CASH continued coming in. In my first week I made between $20 to $30.=20
By the end of the second week I had a made a total of $1,000.00. In the=20
third week I had over $10,000.00 and it was still growing. This is now=20
my fourth week and I have made a total of just over $42,000 and it's=20
still coming in ..... It's certainly worth $6.00 and 6 stamps !!!=20
Also, make sure you print a copy of this article NOW, so you can get=20
the information off of it as you need it. I promise you that if you=20
follow the directions exactly, that you will start making more CASH=20
than you thought possible by doing something so easy!=20
Suggestion: Read this entire message carefully! (print it out or=20
download it.) Follow the simple directions and watch the CASH come in!=20
It's easy. It's legal. And your investment is only $6.00 (plus postage)=20
IMPORTANT: This is NOT a rip-off; it is NOT indecent; it is NOT=20
illegal; and it is virtually no risk - it really works!!!! If all of=20
the following instructions are adhered to, you will receive=20
extraordinary dividends.=20
PLEASE NOTE:=20

Please follow these directions EXACTLY, and $50,000 or more can be=20
yours in 20 to 60 days. This program remains successful because of the=20
honesty and integrity of the participants. Please continue its success=20
by carefully adhering to the instructions. You will now become part of=20
the Mail Order business. In this business your product is not solid and=20
tangible, it's a service. You are in the business of developing Mailing=20
Lists. Many large corporations are happy to pay big bucks for quality=20
lists. However, the CASH made from the mailing lists is secondary to=20
the income which is made from people like you and me asking to be=20
included in that list.=20
Here are the 4 easy steps to success:=20
STEP 1: Get 6 separate pieces of paper and write the following on each=20
piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00=20
bills and place ONE inside EACH of the 6 pieces of paper so the bill=20
will not be seen through the envelope (to prevent thievery). Place one=20
paper in each of the 6 envelopes and seal them. You should now have 6=20
sealed envelopes, each with a piece of paper stating the above phrase,=20
your name and address, and a $1.00 bill. What you are doing is creating=20
a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate=20
service and you are paying for it! Like most of us I was a little=20
skeptical and a little worried about the legal aspects of it all. So I
checked it out with the U.S. Post Office (1-800-725-2161) and they
confirmed that it is indeed legal! Mail the 6 envelopes to the
following addresses:
#1) M. Weber=20
801 Oaklands Dr=20
Round Rock, TX 78681=20
#2) S. Patti=20
1808 Ponderosa St.
Cocoa, Fl.,32926
#3) Gill=20

58 Moross

Mt. Clemens Mi. 48043=20

#4) Ryan Dick

7603 Canyon Dr.

Meridian, ID 83642

#5) Y.S.

2702 A Jenner Dr.

Baltimore, MD 21209

#6) D. Sims

905 Burning Bush Drive

Loganville, GA 30052

step 2: Now take the #1 name off the list that you see above, move the =
other=20

names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number =
6 on=20

the list.

STEP 3: Change anything you need to, but try to keep this article as=20

close to original as possible. Now, post your amended article to at=20

least 300 newsgroups. (I think there are close to 32,000 groups) All=20

you need is 300, but remember, the more you post, the more CASH you=20

make! This is perfectly legal! If you have any doubts, refer to 18=20

Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these=20

steps for yourself and, whenever you need CASH, you can use it again,=20

and again.=20

PLEASE REMEMBER that this program remains successful because of the=20

honesty and integrity of the participants and by their carefully=20

adhering to the directions. Look at it this way. If you are a person=20

of integrity, the program will continue and the CASH that so many=20

others have received will come your way.=20

NOTE: You may want to retain every name and address sent to you,=20

either on a computer or hard copy and keep the notes people send you.=20

This VERIFIES that you are truly providing a service. (Also, it might=20
be a good idea to wrap the $1 bill in dark paper to reduce the risk of=20
mail theft.) So, as each post is downloaded and the directions=20
carefully followed, six members will be reimbursed for their=20
participation as a List Developer with one dollar each. Your name will=20
move up the list geometrically so that when your name reaches the #1=20
position you will be receiving thousands of CASH in CASH!!! What an=20
opportunity for only $6.00 ($1.00 for each of the first six people=20
listed above) Send it now, add your own name to the list and you're in=20
business!=20
---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS=20
Step 1) You do not need to re-type this entire letter to do your own=20
posting. Simply put your cursor at the beginning of this letter and=20
drag your cursor to the bottom of this letter, and select 'copy' from=20
the edit menu. This will copy the entire letter into the computer's=20
memory.=20
Step 2) Open a blank 'notepad' file and place your cursor at the top=20
of the blank page. From the 'edit' menu select 'paste'. This will paste=20
a copy of the letter into notepad so that you can add your name to the=20
list.=20
Step 3) Save your new notepad file as a .txt file. If you want to do=20
your postings in different settings, you'll always have this file to=20
go back to.=20
Step 4) Use Netscape or Internet explorer and try searching for=20
various newsgroups (on-line forums, message boards, chat sites,=20
discussions.)=20
Step 5) Visit these message boards and post this article as a new=20
message by highlighting the text of this letter and selecting paste=20
from the edit menu. Fill in the Subject, this will be the header=20
that everyone sees as they scroll through the list of postings in a=20
particular group, click the post message button.=20

You're done with your first one! Congratulations...THAT'S IT! All you=20
have to do is jump to different newsgroups and post away, after you=20
get the hang of it, it will take about 30 seconds for each newsgroup!=20
**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE=20
MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A=20
minimum of 300**
That's it! You will begin receiving CASH from around the world within=20
days! You may eventually want to rent a P.O.Box due to the large=20
amount of mail you will receive. If you wish to stay anonymous, you=20
can invent a name to use, as long as the postman will deliver it.=20
JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.=20
Now the WHY part:=20
Out of 300 postings, say I receive only 7 replies (a very low example).=20
So then I made $7.00 with my name at #6 on the letter. Now, each of the=20
7 persons who just sent me $1.00 make the MINIMUM 300 postings, each=20
with my name at #5 and only 7 persons respond to each of the 7 original=20
7, that is another $49.00 for me, now those 49 each make 300 MINIMUM=20
posts with my name at #4 and only 7 replies each, I will bring in an=20
additional $343.00! Now, those 343 persons turn around and post the=20
MINIMUM 300 with my name at #3 and only receive 7 replies each, I will=20
make an additional $2401.00! OK, now here is the fun part, each of=20
those 2401 persons post a MINIMUM 300 letters with my name at #2 and=20
they each only receive 7 replies, that just made me $16,807.00!!!=20
Those 16807 persons will all deliver this message to 300 newsgroups=20
with my name at #1 and if still 7 persons per 300 Newsgroups react I=20
will receive $117,649.00! With an original investment of only $6.00!=20
And some stamps. AMAZING! When your name is no longer on the list, you=20
just take the latest posting in the newsgroups, and send out another=20
$6.00 to names on the list, putting your name at number 6 again. And=20
start posting again. The thing to remember is: do you realize that=20
thousands of people all over the world are joining the internet and=20

reading these articles everyday? JUST LIKE YOU are now!! So, can you=20
afford $6.00 and see if it really works?? I think so...=20
People have said, "what if the plan is played out and no one sends you=20
the CASH? So what! What are the chances of that happening when there=20
are tons of new honest users and new honest people who are joining the=20
internet and newsgroups everyday and are willing to give it a try?=20
Estimates are at 20,000 to 50,000 new users, every day, with thousands=20
of those joining the actual internet.=20
Remember, play FAIRLY and HONESTLY and this will really work.=20
** By the way, if you try to deceive people by posting the messages=20
with your name in the list and not sending the CASH to the rest of the=20
people already on the list, you will NOT get as much. Someone I talked=20
to knew someone who did that and he only made about $150.00, and that's=20
after seven or eight weeks! Then he sent the 6 $1.00 bills, people=20
added him to their lists, and in 4-5 weeks he had over $10k.=20
This is the fairest and most honest way I have ever seen to share the=20
wealth of the world without costing anything but our time!!! You also=20
may want to buy mailing and e-mail lists for future CASH. Make sure=20
you print this article out RIGHT NOW! Also, try to keep a list of every=20
one that sends you CASH and always keep an eye on the newsgroups to=20
make sure everyone is playing fairly. Remember, HONESTY IS THE BEST=20
POLICY. You don't need to cheat the basic idea to make the CASH!! GOOD=20
LUCK to all and please play fairly and reap the huge rewards from this,=20
which is tons of extra CASH.=20
Please remember to declare your extra income. Thanks once again...=20
"People have asked me if this is really legal. Well, it is! You are=20
using the Internet to advertise your business. What is that business?=20
You are creating a mailing list of people who are interested in home=20
based computer and online business and methods of generating income at=20
home. Remember, people send you a small fee to be added to your mailing=20
list. It is legal. what will you do with your list of thousands of=20

names?=20

That's up to you." So, build your mailing list, keep good accounts,=20

declare the income and pay your taxes. By doing this you prove your=20

business intentions. Keep an eye on the newsgroups and when the cash=20

has stopped coming (that means your name is no longer on the list),=20

you just take the latest posting at the newsgroups, send another $6.00=20

to the names stated on the list, make your corrections (put your name=20

at #6) and start posting again.=20

NOTES:=20

*1. In some countries, the export of the country's exchange is illegal.=20

But you can get the license to do this from the post office, explaining=20

the above statements (that you have an online business, etc. You may=20

have to pay an extra tax, but that's OK, the amount of the incoming=20

CASH is HUGE! And as I said, a few countries have that restriction.=20

*2. You may want to buy mailing and e-mail lists for future CASH. (Or=20

Database or Spreadsheet software.)=20

*3. If you're really not sure or still think this can't be for real,=20

please print a copy of this article and give it to someone who really=20

needs the CASH, and see what happens.=20

*4. You will start getting responses within 1-2 weeks, it depends.=20

ALSO REMEMBER=20

SEND YOUR $1 OUT TO EVERYONE ON THE LIST,=20

EVEN IF THEY ARE NOT FROM THE U.S.=20

WHAT ARE YOU WAITING FOR???=20

$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!=20

GOOD LUCK!!!=20

download it.) Follow the simple directions and watch the CASH come =
in!

It's easy. It's legal. And your investment is only $6.00 (plus =
postage)

IMPORTANT: This is NOT a rip-off; it is NOT indecent; it is NOT

illegal; and it is virtually no risk - it really works!!!! If all of =

the following instructions are adhered to, you will receive

extraordinary dividends.

PLEASE NOTE:

Please follow these directions EXACTLY, and $50,000 or more can be =

yours in 20 to 60 days. This program remains successful because of =
the

honesty and integrity of the participants. Please continue its =
success

by carefully adhering to the instructions. You will now become part = of

the Mail Order business. In this business your product is not solid = and

tangible, it's a service. You are in the business of developing = Mailing

Lists. Many large corporations are happy to pay big bucks for quality =

lists. However, the CASH made from the mailing lists is secondary to =

the income which is made from people like you and me asking to be =

included in that list.

Here are the 4 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write the following on = each

piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US = $1.00

bills and place ONE inside EACH of the 6 pieces of paper so the bill =

will not be seen through the envelope (to prevent thievery). Place = one

paper in each of the 6 envelopes and seal them. You should now have 6 =

sealed envelopes, each with a piece of paper stating the above = phrase,

your name and address, and a $1.00 bill. What you are doing is = creating

a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate =

service and you are paying for it! Like most of us I was a little =

skeptical and a little worried about the legal aspects of it all. So = I

checked it out with the U.S. Post Office (1-800-725-2161) and = they

confirmed that it is indeed legal! Mail the 6 envelopes to the

following addresses:

#1) M. Weber

801 Oaklands Dr

Round Rock, TX 78681

#2) S. Patti

1808 Ponderosa St.

Cocoa, Fl.,32926

#3) Gill

58 Moross

Mt. Clemens Mi. 48043

#4) Ryan Dick

7603 Canyon Dr.

Meridian, ID 83642

#5) Y.S.

2702 A Jenner Dr.

Baltimore, MD 21209

#6) D. Sims

905 Burning Bush Drive

Loganville, GA 30052

step 2: Now take the #1 name off the list that you see above, move = the other=20

names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as = number 6 on=20

the list.

STEP 3: Change anything you need to, but try to keep this article as =

close to original as possible. Now, post your amended article to at =

least 300 newsgroups. (I think there are close to 32,000 groups) All =

you need is 300, but remember, the more you post, the more CASH you =

make! This is perfectly legal! If you have any doubts, refer to 18 =

Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these =

steps for yourself and, whenever you need CASH, you can use it again, =

and again.

PLEASE REMEMBER that this program remains successful because of the =

honesty and integrity of the participants and by their carefully

adhering to the directions. Look at it this way. If you are a person =

of integrity, the program will continue and the CASH that so many =

others have received will come your way.

NOTE: You may want to retain every name and address sent to you,

either on a computer or hard copy and keep the notes people send you. =

This VERIFIES that you are truly providing a service. (Also, it might =

be a good idea to wrap the $1 bill in dark paper to reduce the risk =
of

mail theft.) So, as each post is downloaded and the directions

carefully followed, six members will be reimbursed for their

participation as a List Developer with one dollar each. Your name =
will

move up the list geometrically so that when your name reaches the #1 =

position you will be receiving thousands of CASH in CASH!!! What an =

opportunity for only $6.00 ($1.00 for each of the first six people =

listed above) Send it now, add your own name to the list and you're =
in

business!

---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS

Step 1) You do not need to re-type this entire letter to do your own =

posting. Simply put your cursor at the beginning of this letter and =

drag your cursor to the bottom of this letter, and select 'copy' from =

the edit menu. This will copy the entire letter into the computer's =

memory.

Step 2) Open a blank 'notepad' file and place your cursor at the top =

of the blank page. From the 'edit' menu select 'paste'. This will =
paste

a copy of the letter into notepad so that you can add your name to =
the

list.

Step 3) Save your new notepad file as a .txt file. If you want to do =

your postings in different settings, you'll always have this file to =

go back to.

Step 4) Use Netscape or Internet explorer and try searching for

various newsgroups (on-line forums, message boards, chat sites,

discussions.)

Step 5) Visit these message boards and post this article as a new =

message by highlighting the text of this letter and selecting paste =

from the edit menu. Fill in the Subject, this will be the header

that everyone sees as they scroll through the list of postings in a =

particular group, click the post message button.

You're done with your first one! Congratulations...THAT'S IT! All you =

have to do is jump to different newsgroups and post away, after you =

get the hang of it, it will take about 30 seconds for each newsgroup! =

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE

MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A

minimum of 300**

That's it! You will begin receiving CASH from around the world within =

days! You may eventually want to rent a P.O.Box due to the large

amount of mail you will receive. If you wish to stay anonymous, you =

can invent a name to use, as long as the postman will deliver it. =

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part:

Out of 300 postings, say I receive only 7 replies (a very low =
example).

So then I made $7.00 with my name at #6 on the letter. Now, each of =
the

7 persons who just sent me $1.00 make the MINIMUM 300 postings, each =

with my name at #5 and only 7 persons respond to each of the 7 =
original

7, that is another $49.00 for me, now those 49 each make 300 MINIMUM =

posts with my name at #4 and only 7 replies each, I will bring in an =

additional $343.00! Now, those 343 persons turn around and post the =

MINIMUM 300 with my name at #3 and only receive 7 replies each, I =
will

make an additional $2401.00! OK, now here is the fun part, each of =

those 2401 persons post a MINIMUM 300 letters with my name at #2 and =

they each only receive 7 replies, that just made me $16,807.00!!! =

Those 16807 persons will all deliver this message to 300 newsgroups =

with my name at #1 and if still 7 persons per 300 Newsgroups react I =

will receive $117,649.00! With an original investment of only $6.00! =

And some stamps. AMAZING! When your name is no longer on the list, =
you

just take the latest posting in the newsgroups, and send out another =

$6.00 to names on the list, putting your name at number 6 again. And =

start posting again. The thing to remember is: do you realize that =

thousands of people all over the world are joining the internet and =

reading these articles everyday? JUST LIKE YOU are now!! So, can you =

afford $6.00 and see if it really works?? I think so...

People have said, "what if the plan is played out and no one sends =
you

the CASH? So what! What are the chances of that happening when there =

are tons of new honest users and new honest people who are joining =
the

internet and newsgroups everyday and are willing to give it a try? =

Estimates are at 20,000 to 50,000 new users, every day, with =
thousands

of those joining the actual internet.

Remember, play FAIRLY and HONESTLY and this will really work.

** By the way, if you try to deceive people by posting the messages =

with your name in the list and not sending the CASH to the rest of =
the

people already on the list, you will NOT get as much. Someone I =
talked

to knew someone who did that and he only made about $150.00, and =
that's

after seven or eight weeks! Then he sent the 6 $1.00 bills, people =

added him to their lists, and in 4-5 weeks he had over $10k.

This is the fairest and most honest way I have ever seen to share the =

wealth of the world without costing anything but our time!!! You also =

may want to buy mailing and e-mail lists for future CASH. Make sure =

you print this article out RIGHT NOW! Also, try to keep a list of =
every

one that sends you CASH and always keep an eye on the newsgroups to =

make sure everyone is playing fairly. Remember, HONESTY IS THE BEST =

POLICY. You don't need to cheat the basic idea to make the CASH!! =
GOOD

LUCK to all and please play fairly and reap the huge rewards from =
this,

which is tons of extra CASH.

Please remember to declare your extra income. Thanks once again... =

"People have asked me if this is really legal. Well, it is! You are =

using the Internet to advertise your business. What is that business? =

You are creating a mailing list of people who are interested in home =

based computer and online business and methods of generating income =
at

home. Remember, people send you a small fee to be added to your =
mailing

list. It is legal. what will you do with your list of thousands of =

names?

That's up to you." So, build your mailing list, keep good accounts, =

declare the income and pay your taxes. By doing this you prove your =

business intentions. Keep an eye on the newsgroups and when the cash =

has stopped coming (that means your name is no longer on the list), =

you just take the latest posting at the newsgroups, send another =
$6.00

to the names stated on the list, make your corrections (put your name =

at #6) and start posting again.

NOTES:

*1. In some countries, the export of the country's exchange is =
illegal.

But you can get the license to do this from the post office, =
explaining

the above statements (that you have an online business, etc. You may =

have to pay an extra tax, but that's OK, the amount of the incoming =

CASH is HUGE! And as I said, a few countries have that restriction. =

*2. You may want to buy mailing and e-mail lists for future CASH. (Or =

Database or Spreadsheet software.)

*3. If you're really not sure or still think this can't be for real, =

please print a copy of this article and give it to someone who really =

needs the CASH, and see what happens.

*4. You will start getting responses within 1-2 weeks, it depends. =

ALSO REMEMBER

SEND YOUR $1 OUT TO EVERYONE ON THE LIST,

EVEN IF THEY ARE NOT FROM THE U.S.

WHAT ARE YOU WAITING FOR???

$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!

GOOD LUCK!!!

The beacon on RS15 is about 10 dB stronger than the transponder. It
takes an Oscar 10/13 class station to get a decent signal through this
bird. (high gain directional tracking antennas) It's operation also
seems to be intermittent.

Oscar 10 (AO10) is getting harder to work every day. It is now tumbling
as well as rotating, which makes for a very unpredictable and bizarre
QSB situation. It only seems to be workable within about 20,000 KM of
earth, with high gain VHF/UHF antennas, and typically for only about 30
seconds at a time. Due to varying sunlight, it also FM's a lot making
frequency tracking a difficult job. It's beacon is not stronger than
transponder signals however. This old crippled bird will be largely
deserted when P3D becomes operational. It's brain dead, battery dead,
and now tumbling.

The VHF ground stations in the US are at Wallops Island VA, White Sands NM,
and Dryden CA (near Edwards Air Force Base).

RS15 is non-functional most of the time so many sat guys don't bother to listen. (I have been hearing the beacon lately also). Regarding AO-10 try listening during the next few days during the evening. There is usually a few stations on the bird (near the middle of the passband) during passes when it dips below 12000 KM while it passes over the US. It will shut off as soon as the bird passes into darkness but it will be in the light for a couple hours after the US is in darkness.

RS13 is the most popular bird. It just switched to mode KT (15 mtrs up, 10 and 2 mtrs down). FO20 and FO29 are my favorites. You will hear a few stations on those birds every weekend.

The communication is fullduplex, the groundstation is on another frequency.
So even when you are close to it, you won't hear it when you are on
143.625. What you are hearing is the audio feedback.

2000-11-10 18:00 UTC: The ARISS team has just been informed by Mission Control in Moscow that the crew confirmed that they had installed the amateur radio hardware in the FGB. Several engineering test passes need to be performed before general ham radio operations can commence. This is a major step forward for amateur radio in human spaceflight.

The ARISS web pages are at http://ariss.gsfc.nasa.gov/

The current team has performed no EVA's since arrival on station.

However the lower voice you heard possibly was the ground control being heard in close proximty to the mike one of the team was using....? That's my best guess....I've heard that too...and assumed it was ground station via the ISS station's mike. If not that, perhaps it's the second Russian team member but I would ahve expected his voice to be the same level.

Hi Guys

I have downloaded UIView (uisfx232.exe from ..propnet/beaconnet/level-2) onto my internet computer. File size is around 1.9 megs.

I have to install UIView on my ham radio computer in another room, which is not on the internet. Normally I can transfer files via floppy, but this one is too big.

I tried to open uisfx232.exe to just copy and transfer the individual files, but it doesn't seem to simply unzip the files - it wants to install directly from the exe.

I thought maybe I could break it up using winzip, but winzip says it doesn't recognize it.

Is there any way to somehow use a 1.44 MB floppy transfer system with this?

Any ideas?

Heard the ISS clearly on Thursday 11/9 in Northern Ohio from 1937 to 1942 GMT. I heard Two different voices, one signal stronger than the other, both in Russian, seemingly in conversation. I wouldn't think that I could hear the groundstation from here. Does anyone know the locations of groundstations in the USA authorized to talk to ISS? Is it possible that I was hearing module-to-module communication on that frequency? Possibly was it an EVA event I was hearing?

I heard the same stuff at the same time (approximately) here in Connecticut. It was clear that they're running full duplex - you could hear the other guy (ground) in Russian but in the background - much lower. The mix was either audio - you could actually hear the microphone 'creak' at one point --- or there's just a little 'sidetone' built into the system.

Heard the ISS clearly in Northern Ohio on Thursday from 1937-1942 GMT.
I heard two voices, seemingly in conversation with each other, one
signal more distinct than the other. I wouldn't think that I could
hear the ground station from here- is it possible that they were
communicating from module to module over this frequency? Or, perhaps
there was an EVA going on? Since I don't speak Russian, I couldn't
follow the actual conversation. Does anyone know the location of
groundstations in the USA that are authorized to talk to ISS?

I mean that Debian won't include something when there is the slightest sign
of non-freeness. SuSE is much more liberal, and even includes sample
versions or licensed versions if binary-only commercial packages.

Some packages are not included with some distributions because the
licenses somehow conflict with the taste of the distributor. But that
should not be a problem in this case, I wanted to indicate.

It seems like the crew in the station is not using headphones, but a
speaker. The groundstation probably uses headphones.

AAA> I'd add though that there is the possiblity too that a
AAA> civilization that "really" (REALLY) wanted to make themselves
AAA> known to others in the Galaxy would transmit a powerful signal
AAA> detectable easily by even a 3 or 5 meter dish. They wouldn't make
AAA> it hard to detect!

I've left this paragraph because it's what started all of this. As
you know from writing the portion of the sci.astro FAQ, such a
civilization would have enormous amounts of power at its disposal to
transmit such a powerful signal. Even our most powerful radars would
just be detectable over interstellar distances to a 3--5 meter
antenna. To be detectable over 1000 light years or more to a 3--5
meter dish requires *lots* of power, hence my focus on supercivs.

AAA> The independent variables are space, time, and frequency.

I think some people add polarization to this list.

AAA> If you look at all space at once then P1 = 1 (...). Even if you
AAA> look at all the sky at once you still have the time factor (how
AAA> long to look) to worry about. How long to look depends on how
AAA> many civilizations are out there "pinging" away, the duration of
AAA> the "ping", the time it takes their beam to sweep past the Earth,
AAA> and the repetition rate (...).

AAA> META did not look at all the sky at once. It takes one year to
AAA> cover the sky. There were(are) plenty of opportunities to miss a
AAA> signal momentarily directed at Earth.

Right, and if you read Section 5 of Horowitz & Sagan (1993), you'll
see that they actually phrase their limits in terms of the product of
the transmitted power and duration of transmission.

AAA> I think assuming a continuous transmission directly to Earth is
AAA> being too optimistic. To assume continuous transmission and then
AAA> deduce on a negative result that there are "no
AAA> supercivilizations" out there is just wrong.

Nonetheless, the most simple assumption is that the transmitter is on
100% of the time. I think that is the assumption behind the notion of
interstellar beacons, certainly if those beacons are being used by

advanced civs in an effort to transmit an Encyclopedia Galactica to
less advanced civs (as some have speculated).

Thomas Edison describes in his patent application for the wireless telegraph in May of 1885 as follows;
For receiving signals I locate in said circuit between condensing surface and the ground a diaphragm sounder which is preferably one of my electro motograph telephone receivers.

The first wireless telegraph picked up the telegraph signals with a loud speaking telephone. De Forest patented his triode in 1907 twenty two years later. For his first radio he used an Edison loud speaking telephone.

Edison's Patent and an essay about wireless transmission can be seen on my site at www.geocities.com/starapex Click on the radio

Cheers

Where would I be able to download a tracker program for the ISS.

I do not need a tracker that controls the antennas just a real simple tracking program that will tell me when the ISS is coming into range and for how long it will be in range. That kind of thing.

As well I know that you can listen to ISS, I think it is listen only, on 143.625, but are there any other frequencies that are available for communication with them??

Thanx. I am kind of new to the satellite communication thing so I do need a little help sometimes!

See above...

>As well I know that you can listen to ISS, I think it is listen only, on
>143.625, but are there any other frequencies that are available for
>communication with them??

143.625 is the Russian ground control freq. DO NOT TRANSMIT there,
it's not a ham frequency.

"The initial station gear--already aboard the ISS--will be installed
temporarily in the Zarya Functional Cargo Block of the ISS and will
permit operation only on 2 meters--FM voice and packet. Tentative
operating frequencies are: Worldwide downlink for voice and packet,
145.80 MHz; worldwide packet uplink, 145.99 MHz; Region 1 (Europe)
voice uplink: 145.20 MHz; Region 2 and 3 voice uplink, 144.49 MHz. Yet
to be determined is the ARISS operating schedule, which will depend on
the crew's schedules. The ARISS Team eventually anticipates multiband,
multimode operations with the crew and regularly schedule expected to
be very busy with basic housekeeping duties to prepare for their
four-month-long mission, Marchant explained. "The crew has expressed a
high level of interest in beginning Amateur Radio operations early in
the mission," he said. Crew members may use their personal call signs
or one of the "club station" call signs issued for ISS use--NA1SS,
RZ3DZR, or DL0ISS. QSLs and SWL reports will be processed via the ARRL
or Radio Amateurs of Canada. The card design is being finalized, but
it should be ready for distribution early next year.
The Expedition 1 crew will work on UTC, with their day expected to
begin around 0800 UTC and end near 1900 UTC (with a possible "lunch
break" near 1200 UTC). The crew also is off from 1200 UTC on Saturday
until the end of the day on Sunday. "

>Thanx. I am kind of new to the satellite communication thing so I do need a
>little help sometimes!

No problem!

(This is a GREAT site, thanks)

I left my RS2006 on last night (143.6250) and was awoken
when my squelch opened up, but there were no voices.

I waited for the ISS to overfly my location today (I used
http://spaceflight.nasa.gov/realdata/tracking/index.html) however,
I never heard it.

Do I select AM, NFM, or WFM? When using WFM I think I heard
a series of squelch breaks which sounded somewhat like a
conversation... speculation is running wild here ;-)

Do I need an antenna besides the standard one?
TIA

Instead of trying to unzip it, just try zipping that file to a floppy.

I have a cd writer I usually use and use to transfer the large files
with a rw disc.

I also have a network card in each computer and connect them that way
sometimes.

At the price of some modems when they are on sale you could just get one
of the cheap ones. I have bought them for about $ 10 after the rebate
and did see one for about $ 5 after a rebate in the paper theother day.

Yes, it would require lots of raw power!

If the power is "beamed" then it may not be so difficult though, even for
a "primitive" civilization. For example a really fine 12ft dish antenna
system could just barely detect a narrowband signal at 1.42GHz at a
range of 1500LY from a transmitter with an EIRP of 2000 Terrawatts
(2*10^15W) :-}. I used a bandwidth of 0.01Hz, Tsys = 20, and 200
seconds integration time (I know I'm pushing the limits, but it is not
impossible! Far from it). This (2*10^15W) is huge I admit, but
Arecibo's 305m dish antenna has a gain of 2*10^7 so the actual raw
power required would be only 100 Megawatts. This is doable, even
by us perhaps. If a transmitter 3000m in diameter were used then it
would have a gain of about 2*10^9 so that only 1Megawatt of power
would be required. It might get costly though to transmit continuously.
A supercivilization could do it easily I admit ...

It might be that "super civilizations" do not care to communicate with
lesser civilizations. It could be embarrassing too! Imagine me trying
to communicate with an ant :-)

It is disturbing to me that there does not appear (appear) to be any
evidence, except perhaps for the Universe itself, of super technology

out there. Maybe it is just because we have so much more to learn?
Maybe intelligent life is so rare only one in 10 galaxies has intelligent
life in it? Who knows?

Did you read the article by Eric Schulman "Where Are They" in the
Nov/Dec Mercury magazine? At about 400BC the Greek mathematician
and philosopher Metrodorus wrote: "It goes against nature in a large field
to grow only one shaft of wheat, and in an infinite universe to have
only one living world". There might be infinite civilizations out there,
like
a field of wheat, but the nearest civilization (shaft of wheat) may be in
the
next Galaxy or even farther beyond.

It is disturbing that we don't see evidence of super technology "out there",
but I'm sure they are out there nonetheless.

I guess I got worried because I thought you were saying META showed
that there were no supercivilizations out there. I apologize if I
misunderstood ...

> interstellar beacons, certainly if those beacons are being used by
> advanced civs in an effort to transmit an Encyclopedia Galactica to
> less advanced civs (as some have speculated).

Think of a light house. The beacon is on all the time, but only a fraction of the sky gets illuminated at any instant. It flashes by. If you record it you'll see a blip and that is all. The META search is like a beacon too. They look all the time but only briefly at one spot in the sky at once. It takes one year to view the whole sky (the blip rate with META is 2 minutes per year... so reverse that and think of the blip rate for an equivalent META transmitter ... it might be similar, 2 minutes per year thats all we'll get).

The META results just say, in my opinion, that no one is transmitting continuously during the time period that META has looked. It doesn't mean they are not out there.

I think it is tremendously optimistic to assume a super civilization will transmit unimaginable power omnidirectionally for long periods of time! It would be foolhardy! Why should they? Think of that analogy of a super civilization trying to communicate with an ant (imagine trying to get funding from Congress for that) ...

All I'm saying is that it doesn't seem all that odd that META didn't find anything in 5 years. It is not wasted effort! We need to keep looking and improve the search ... no one says the "signals" have to repeat! We just need to accumulate more data and statistics just like seti@home is doing now ...

What do you mean "when even Debian includes it"? Debian has a good
selection of ham radio packages.

When you consider the number of officially supported packages (in all areas,
not just ham radio), from Debian, Red Hat, SuSE etc I suspect Debian has
far more than all the others.

Debian has been around for quite a few years. We just don't see
the need to play the version numbers game Red Hat, SuSE and Mandrake
are playing.

My guess is that we're hearing a bit of what's in the headphones.
You DO hear one of the other guys in the background though I believe
from time to time. Maybe listening in to what Russian ground control
is saying, you know, being in on what's being said from the ground.

I know they have a clear policy, I just don't agree with it.
But I am using SuSE Linux, so that doesn't matter.

>with Keps in the proper directory before it will run?

Now you will have to read the manual... It is named "sattrack.doc" and
it originally lived in a doc subdirectory of the source archive. It will
probably have been placed somewhere under /usr/doc by the rpm.

The tlex.dat is basically just a 2-line keps file. There are several
scripts included with sattrack that build this and other files from
downloaded data, but they are a bit complicated and too much hard-wired
to specific situations (like the 129.92.1.66 ftp server that no longer
exists). You will have to do some editing, or use another method to
collect 2-line keps.

I could post my version of gettle (converted to bash shell) but you would
need to edit it as well.

2784. Why do two sources for ISS location differ ?

Newsgroup: rec.radio.amateur.space
Date: 2000-11-12 00:00:00 UTC
From: Pervert_Extraordinaire <valued_customer@att.com>
Message-ID: <3A0ECFB5.AB80D881@att.com>
Source record: 7972

I am trying to receive the 143.6250 frequency from the ISS.

I've been tracking the location of the ISS via the following:

Punch hole 1)
http://liftoff.msfc.nasa.gov/temp/StationLoc.html

Punch hole 2)
http://spaceflight.nasa.gov/realdata/tracking/index.html

Why do these two sources differ (for me). Presently the
first link places the ISS just east of Africa. The
second link places the ISS just west of Africa.

FYI, I'm in that odd part of Indiana that doesn't go
to daylight savings time, and I understand these links
use the PC system clock.

Any suggestions?

it may well be that they do not update the keplarian elements at the same time or they are basing their tracking base station time differently. ie. one GMT and one a different time although usually they all base on GMT. and don't forget inetrnet lag that may differ from each of them if they are real time.

On Saturday 11/11 from Northern Ohio, at 1248 GMT I heard an ISS crewman say a few words, then there was a few seconds of dead air, then instant static- sounded like they shut the transmitter off. As they passed over three orbits later, at 1738 GMT, the transmitter was still silent. One orbit after that, at 1913 GMT, I heard the signal come on, a voice said "Hallo- hallo- hallo-" then some ensuing chatter in Russian.

So what was this all about? A sleep period perhaps, or maybe transmitter maintenance?

Just for the record, I track satelites using SatSpy 3.03, I get element sets from the NASA Orbital Information Group at http://oig1.gsfc.nasa.gov/scripts/foxweb.exe/app01? and monitored the frequency on an Alinco DJX10 attached to a mobile mount 2M antenna.

Thanks Ian, I added ~6 minute offset to mt PC clock and they came
closer.
Apparently the http://spaceflight.nasa.gov/realdata/tracking/index.html
site uses the system clock. I was amazed how much distance is
'traveled'
in a six minute 'offset'.

This leads me to question which is 'right'? Is there some definitive
method of tracking the ISS?

By going back and forth between pages
they appear to be 40 sec different in UTC.
They are not using your PC clock but they do appear to be using
either two different clocks or their connection speeds to "the" clock
are varying in speed.

Either way it doesn't make much difference to the location.

The http://spaceflight.nasa.gov/realdata/tracking/index.html site
appears to be affected by changing my system clock. I can't seem
to get them to agree sufficiently to trust either?

Sorry 'bout my ignorance.

Oh, we agree essentially completely. META, and SETI in general, are
not wasted efforts. However, we cannot ignore the results of META.
If there are supercivs in the Milky Way, they are not falling all over
themselves to make themselves known to less civilizations like us.

You certainly need an accurate clock. Something that you manually set plus
or minus 6 minutes is not accurate enough for good results.
I use a DCF77 receiver, but that only works in Europe. Similar
possibilities exist in the US.

Even then, the keplerian elements are not very accurate when they are not
frequently updated. And even with very recent elements I get positions
that differ by (up to) a couple of degrees when compared to the screens
shown at NASA TV.

There are several programs that will let you run the passes in advance.
Look at amsat.org to see if they have any free or sharewear programs
that might work for you.

Excellent comments. I've recently done some work generating Two-line Elements (TLEs) and comparing them with high quality spacecraft ephemerides. For a spacecraft in a very low orbit like ISS (I used TRMM), I was able to generate TLEs that predicted the orbit to within about 30 km after two days. Near the TLE epoch, the agreement is typically less than 1 km (sometimes as low as 250 meters!).

The element sets generally reflect maneuvers only after the maneuver has occurred. Consequently a one or two day old element set can give predictions significantly in error if a maneuver occurred after they were generated. Other factors can greatly affect the ISS orbit, such as solar flares. Although it is massive, atmospheric drag is the second most significant force acting on it (after gravity).

Source record: 7966

I found two versions of 3.1.6 which were rpm's converted from .deb
packages (took the cowards way out!). One was sattrack-x11-3.1.1, and
the other was just sattrack-3.1.6.
Now I get an error about "tlex.dat not found". Do I have to pre-load it
with Keps in the proper directory before it will run?
Guess I'll just keep looking for the source, use your graciously
provided makefile, and try it that way.
At least I'm getting closer!

Those RPMs are converted from my Debian package (by me).

You need to run "maketlex" after installation (as root).
There are some keps provided (although they're a bit old now).
The Debian package runs maketlex upon installation automatically,
but the converted RPMs don't.

Debian has a very clear policy on what's an acceptable license,
so that there is no need for subjectivity. See the Debian Free Software
Guidelines at http://www.debian.org/social_contract

[cut]

In the frequency file (stsplus.frq from 11 november 2000) for the
STSPLUS tracking software the uplink fq is stated to be 139,2080 with
the downlink fq 143,6250 for "ISS-VHF1". There are also a number of
other fq:s available for the ISS, but I don't know if they are used at
this time or not.

Another option would be to use the Windows "direct cable connection" . You
may have to add it (under
accessories/communications) to your system, and make up a cable long enough
to reach, but it does the job.

2805. 9600 baud Pacsat HT or mobiles?

Newsgroup: rec.radio.amateur.space
Date: 2000-11-13 00:00:00 UTC
From: Ken Harris <KHarri4@attglobal.net>
Message-ID: <3A103349.CF601EF7@attglobal.net>
Source record: 7851
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.space

Are there any mobiles (or HTs) that can do 9600 baud pacsat?
I noticed the Kenwood TM-D700A says, "Satellite packet ready",
but it looks a bit bulky and expensive.
Seems to me that they need at least 3 things:

1. 9600 baud
2. 2m/70cm full duplex (separate antenna connectors would be nice)
3. fairly fine frequency control to compensate for doppler

I noticed that the Alinco DJ-G5TH (HT) says, "full duplex".
I suppose this is designed for the AO27.

The Yausu FT90R says, "9600 baud". It looks real small
and is not too expensive.

The launch is scheduled for 11/15/00 01:07UTC Tuesday evening U.S. time.

The Launch Information Net also will be carried by key HF stations, led by the Goddard Amateur Radio Club's WA3NAN (http://garc.gsfc.nasa.gov/www/retransmission/retrans_status.html). WA3NAN expects to be on the air an hour prior to launch and will re-transmit on its shuttle frequencies, 3.860, 7.185, 14.295, 21.395, and 147.45 MHz. W5RRR at the Johnson Space Center in Texas - or its alternates - will use 3.840, 7.279, and 14.282 MHz.

The Radio Club of Kourou FY5KE also has announced plans to broadcast the Phase 3D launch on 14.315 MHz in French "and probably in English."

Please read the following URLs. The information Reed has supplied is not correct as far as I'm aware.

143.625 is NOT a beacon frequency. It is the Russian Downlink from ISS to the Russian Ground Control.

http://ariss.gsfc.nasa.gov/ExpeditionOne/

For Ham Radio Tentative Frequencies are:
Initial operations will only take place on the 2m band.

Here are the tentative frequencies for Expedition One operations: Worldwide downlink for voice and packet: 145.80
Worldwide packet uplink: 145.99
Region 1 voice uplink: 145.20
Region 2 & 3 voice uplink: 144.49

Reed, please quote your source or correct your comments.

He is confused between amateur radio and regular operations.

143.625 is the regular downlink (corresponding uplink is 139.208), you
may use it as a beacon when you are in a groundstation coverage area.

145.800 is the amateur radio downlink. Of course you may want to scan
uplinks for curiosity, but it is not really useful.

SB SPACE @ ARL $ARLS018
ARLS018 ISS crew completes installation of Amateur Radio hardware

ZCZC AS18
QST de W1AW
Space Bulletin 018 ARLS018
>From ARRL Headquarters
Newington, CT November 13, 2000
To all radio amateurs

SB SPACE ARL ARLS018
ARLS018 ISS crew completes installation of Amateur Radio hardware

According to Will Marchant, KC6ROL, the International Space Station crew has completed installation of the Amateur Radio hardware in the Functional Cargo Block.

With the successful execution of engineering tests today, the Amateur Radio on the International Space Station (ARISS) project has passed a significant milestone. The initial two passes were tested at the Gagarin Cosmonaut Training Center (GCTC) ham shack R3K in Star City near Moscow. The control operators were Sergej Samburov, RV3DR, and Vladimir Zagainov, UA3DKR. Sergej is the Russian delegate to the ARISS team.

Subsequent tests at the NN1SS station at the Goddard Space Flight Center (Greenbelt, MD) and the W5RRR station at Johnson Space Center (Houston, TX) were equally successful. Engineering tests with the packet rig still need to be organized.

The crew, while still very busy, expressed their interest and support of Amateur Radio activities on the ISS. It seems likely that over the next few weeks, as the crew's schedule settles out, amateurs may be able to look forward to more Amateur Radio activity from humanity's latest foothold in space.

META stands for "Megachannel ExtraTerrestrial Assay". It is
a SETI program conducted at Harvard University by Prof Paul
Horowitz and his students. A very innovative project using
MC68000 CPU's to do FFT's over a 400KHz band. The
bin spacing is 0.05 Hz. The project is sponsored by the
Planetary Society. The project began operations in late 1985
using the Harvard's 26 meter dish radio telescope. At 1.42GHz
the beamwidth is about 0.5 degrees. It performs a transit
search of the sky. It is moved in declination by 1/2 beamwidth
each day until the sky from -30 deg to +60 deg declination is
covered. It takes about one year to cover the whole sky. They
ran for a number of years until (I think) a big wind blew the
dish antenna down (last year). The Planetary Society is currently
raising funds to help get the telescope back in operation.

Harvard also runs project BETA (billion channels). The Planetary
Society provides support both to Harvard and an Argentina BETA
survey.

Check the Planetary Society web pages for more information
(http://www.planetary.org/html/UPDATES/seti/index.html) or
the Harvard SETI web site (http://mc.harvard.edu/seti/) ...

Projects META, and BETA, have covered the whole sky a number
of times already without any positive results. A paper was published
in 1993 by Horowitz and Sagan in the Astrophysical Journal
describing results after five years of looking.

Joseph summerized the results well. If there were any supercivilizations
out there putting any high level energy over long periods of time in the
waterhole region, during the time that they looked, then META/BETA
would have detected that. They found nothing really. There were a
number (37) really high level spikes detected but they did not repeat
so not much could be said about them. The highest level signals did
show up in the Milky Way region though. Still, if they don't repeat you
really can't have high confidence in them.

The evidence seems to be building up that there are no super civilizations
out there using extreme technology and energy (capable of harnassing the
power of planets or stars or even whole galaxies). The META/BETA
radio search in the waterhole region is another added piece of evidence ...

Much more work needs to be done though before we write
supercivilizations off ...

I use an old freeware version of SocketWatch (1.2) that works
flawlessly to sync time on the PC.

Same here Tom, I use Nova and satspy and at a horribly early hour this morning I visibly clocked both a Lacrosse milsat and a cosmos nav sat to the second and with regard to satspy I have it accurate to the nearest star, ie. as it is going past a star on the screen it is in the exact same place in the heavens. It makes life so much easier when you take great care to setup a tracking programme properly and keep keps well up to date and tim ebang on.

I can also reccomend a programme called Atomtime for computer clock keeping this syncrinises your PC clock to an atomic clock via the internet.(for those who do not know about it.)

regards

ian koenig

I can also reccomend Satspt it is an excellent programme if you set it up correctly always bang on time and prediction, I only wish that the Author would include a button to turn the screen to night vision instantly (like skymap etc) after all it seems silly that the purpose of the programme is for seeing satellite at night when your night vision is so important the occasion may get spoiled by the gare of the screen.

Author please take note ;-).

other than that excellent !!

The crew has been granted the entire weekend off. ;-) SO who knows what it might have been. As far as I'm aware they had nothing scheduled with ground control for the whole weekend. I can't remember if they were supposed to have today off too or not...(Monday?)...seems like I heard that...but I don't clearly remember. This was the first long break they've had since arriving on station.

I got this info from watching NasaTV.

I have listened to 143.625 for a week now. That freq is a full duplex downlink. The uplink freq is a different freq and I am not sure what it is(should be 144.95). The chatter I hear sounds like a discussion and not just rag chew. I think its a full time downlink comm freq to their controllers. I hope to hear them talking English to the only American onboard sometime but so far only Russian. I assume the Russians are doing the controlling of the ISS at this point. They use the 143.625 alot and they are on it on every pass over the US so far this week.

Man, this is intense. It's really happening. Wow.
This is one of the the greatest projects for ham radio ever.
Imo.

Anyway, I just feel the need to say thank you now,
before the launch. Just so that maybe a few people will
know that they are appreciated however this goes.
(Hopefully well -- knock on wood.)

2836. AMSAT Phase 3D pre-launch element set.

From: "Kenneth J. Ernandes" <n2wwd@mindspring.com>
Subject: [amsat-bb] Updated Phase 3D Orbital Data Estimates
Date: Sun, 12 Nov 2000 19:52:01 -0500

Below is the estimated State Vector and Keplerian Elements for
the AMSAT Phase 3D spacecraft. The vector data was computed from
Arianespace orbital parameters at the time Phase 3D is scheduled
to separate from the Ariane 5 upper stage. The Keplerian Elements
were computed, in turn, from the vector.

Vector format = 10107
Satellite Name: Phase 3D
Catalog Number: 93400
Epoch MET: 0.02983771991
0/00:42:57.979 MET
EFG E: 4321.19714449 km
F: 10857.07279003 km
G: -1323.50573459 km
Edot: -3.1484853319 km/s
Fdot: 5.7556066452 km/s
Gdot: -0.5488001613 km/s
ndot/2 (drag): 0.00000000771 rev/day^2
nddt/6: 0.00000E+00 rev/day^3
Bstar: 1.25668E-05 1/Earth Radii
Elset #: 1
Rev @ Epoch: 1.52588079822

Launch Window Opens: 2000-NOV-15 / 0107 UTC
Phase 3D separation: Launch + 0042:57.979

The following Keplerian elements were computed from this vector and
the scheduled date and time of the launch window opening. Updated
Keplerian elements will be computed from the vector, based on changes
to the scheduled or actual launch time.

Phase 3D
1 93400U 00320.07636550 .00000001 00000-0 12567-4 0 13
2 93400 6.5034 246.6469 7357988 175.9296 13.3886 2.02435417 17

Satellite: Phase 3D
Catalog number: 93400
Epoch time: 00320.07636550
Element set: 1
Inclination: 6.5034 deg
RA of node: 246.6469 deg

Eccentricity: 0.7357988
Arg of perigee: 175.9296 deg
Mean anomaly: 13.3886 deg
Mean motion: 2.02435417 rev/day
Decay rate: 7.71000e-09 rev/day^2
Epoch rev: 1
Checksum: 283

Note that "93400" is a temporary Catalog Number. A Permanent Catalog Number and International Designator will be assigned when Phase 3D is launched. The satellite name will also be updated with the next sequential "OSCAR" designator.

These Keplerian elements represent a pre-launch estimate of Phase 3D's initial orbit. The orbit will change significantly over the first year the spacecraft is on orbit. Updates will be provided for significant orbital changes.

The Phase 3D launch team will be publishing a similar set of Keplerian elements. The data provided by the launch team will be "osculating" parameters, compatible with AMSAT command station software. The osculating elements are the exact physical representation of the orbit as opposed to the "mean" parameters provided in this bulletin. I provide these mean elements as they are fully compatible with the NORAD SGP4/SDP4 orbit propagation algorithms. Tracking software that uses the NORAD propagators should use the "mean" Keplerian elements provided herein for the most accurate result. Tracking software using non-NORAD orbit propagation methods should use the "osculating" elements provided by the Phase 3D launch team.

2838. Re: Why do two sources for ISS location differ ?

Newsgroup: rec.radio.amateur.space
Date: 2000-11-13 02:24:34 UTC
From: aa1339@yahoo.com
Message-ID: <3a0f4ea3.550696459@news.gl.centurytel.net>
Source record: 7988

I've been using SatSpy for several years and it hasn't failed to show
the exact position of any Earth orbit object I've tried to track.
From their website (www.satspy.com) you can download a shareware
version. The registered version is $40, well worth the investment.

Another critical item is your element sets. The most current I've
found are at the NASA Orbital Information Group:
http://oig1.gsfc.nasa.gov/scripts/foxweb.exe/app01?
The elements change daily, make sure you always have a fresh set.

Lastly, you need an accurate watch, one you can set to the second via
WWV. Make sure you set the watch and your computer clock accurately
and frequently.

2839. Re: Why do two sources for ISS location differ ?

Newsgroup: rec.radio.amateur.space

Source record: 7989

Addendum to my last posting:

Another item you need to know- your exact latitude and longitude to the second. If you can't get it from a map, use a GPS.

With the right data- element set, time, and location, just about any object you want to track will show up at the exact second you expect it to.

E-mail list for Mir, HST and ISS orbital elements: There is a fairly
new e-mail list to get the LATEST orbital data for MIR, HST and the
ISS! Here's how to join: send an EMPTY e-mail message (nothing typed
in the subject line or message body) to: tlelist-subscribe@idb.com.au
You will get a message back, simply reply to it following it's
instructions, and you'll be all set and sent another confirmation/info
message.

I get new elements (all 3 in one e-mail) just about every single
day. Excellent service!

73,

Tom - KB2SMS

I'll also add that you should set your system clock to WWV or a GPS
unit and keep it accurate that way...if you want the plots/data to be
on target. My ISS tracking plots match almost to the second to the
downlinks I hear from the station.

Arianespace Flight 135 is Delayed 24 Hours
11/14/00
The launch of Arianespace Flight 135 has been postponed for one day following an
anomaly in the ground-based infrastructure at the Spaceport in French Guiana. This
anomaly, which affected the telemetry link with the PAS-1R satellite, occurred during the
final countdown on Nov. 14.

As a result, Flight 135 has been delayed for 24 hours. The launch window is as follows:

Kourou time: From 10:07 p.m. to 11:03 on November 15
GMT: From 1:07 a.m. to 2:03 a.m. on November 16
Paris time: From 2:07 a.m. to 3:03 a.m. on November 16
Washington, D.C. time: From 8:07 p.m. to 9:03 p.m. on November 15

2844. Space Station Alpha begins testing 2-meter Amateur Radio Station

Newsgroup: rec.radio.amateur.space
Date: 2000-11-14 00:00:00 UTC
From: N1RZ <n1rz@timhavens.com>

Space Station Alpha begins testing 2-meter Amateur Radio Station

November 14, 2000

By Miles Mann WF1F,
MAREX-NA (Manned Amateur Radio Experiment, North American Division)

Space Station Alpha on 2-meters:
Yesterday the International space Station Alpha began testing the crew's new Amateur Radio station on the 2-meter band. The Amateur Radio station is used by the ISS crews during their fee time to provide the crews with an extra way to entertain them selves and to talk to school children during pre-arranged school schedules. The Russians have been using Amateur radio on Mir since 1988 and have found it to be very beneficial for crews on long duration missions. The Mir Amateur radio was even used as a emergency comminations link on many occasions, and I have even heard rumors the amateur radio link on the NASA Shuttle was used to inform the Shuttle crew of an antenna switch problem which disconnected the Shuttle from the normal voice channels.

The testing of the Amateur radio station initially took place while ISS was over Russia during two prearranged test orbits.
1 pass 6:17-6:25 UTC (9:17-9:25 MSK)
2 pass 8:53-9:03 UTC

The Amateur Radio station on ISS consists of a commercial grade hand held radio called a HT. The radio operates in the ITU satellite portion of the amateur radio 2-meter band 144.000 - 146.000. The exact frequencies used during the test are of course a closely guarded secret, however when testing is completed the radio will be placed on one of the published public channels. The ISS Amateur Radio station is not currently open to the public at this time.

Russian view of the test:
The club station R3K at RSA Energia in Korolev Russia (near Moscow) was equipped with two different 2-meter radio stations to simulate typical amateur radio home stations. One station is what we call an Oscar class station and the other a typical home station.

Station #1:
Transceiver, Oscar Class 180 watts RF FM. Antenna 20 element Circular polarized, gain approximately 9+ dBd, Approximate ERP 1440 watts

Station #2:
Transceiver, Mobile Class 50 watts RF FM. Antenna, Vertical collinear 7 meters in length, gain aprox 6 dBd, Approximate ERP 200 watts.

The first pass test used the big station #1. This orbit was a low orbit pass, only getting 28 degrees above the horizon, and its closest approach to the station was just over 700 kilometers. Cosmonaut Musa U2MIR was to be the first person in the club station to make the contact, however Musa was a little late for the schedule. So the task fell upon Sergej Samburov RV3DR to make the first contact with ISS via Amateur Radio. (Sergej Samburov is also the manager of the club station at RSA and the club station on ISS.) The initial contact took place on schedule and the microphone was quickly passed around the room to the other present, including Vladimior Zagainov, UA3DKR and Eugene Labutin, RA3APR. The audio and signal quality were excellent, we use the term DFQ, Darn Full Quieting. The contact lasted 10 minutes as the space station traveled from horizon to horizon. A strong signal was maintained during the whole 2-way conversation.

The second test orbit used the lower power station with a smaller antenna. This orbit was also a low orbit pass, only getting 28 degrees above the horizon, and its closest approach to the station was just over 700 kilometers. On occasions you may get an orbit directly over your house and the station will be only 400 kilometers away.
The signal quality was noticeably lower and there was considerable noise on the signal during the beginnings and end of the 10 communications pass. The difference in signal strength was primarily because of the lower gain antenna on the club station. The bigger the antenna, the more signal you can pull in. The ISS crew and club station member enjoyed another 10 minute conversation and declared the initial voice testing of the Amateur Radio station a success. Cosmonaut Mikhail Turn was present during the testing. It will be Mikhail job to install the new Amateur Radio antenna on ISS during his expedition 3 ISS mission in 2001.

After the test Sambrov and I discuss the signal quality and compared it to the Russian Space station Mir. The Mir station had a slightly better antenna and it had the ability to select different transmitter power levels with the Kenwood TM-733 settings of 5,10 and 50 watts output. To help conserve power, the Mir station was usually kept on the 5 watt setting. The signal quality results of this ISS test were similar to signal quality reports from Mir, when Mir was using the 5-watt setting. The ISS transceiver has an estimated ERP transmitter value of 1.5 watts. These results are still preliminary. However, it looks like stations with a zero gain antenna will be able to hear ISS and will be able to establish 2-way connections on good close orbit passes. Sergej then said, there are plans to upgrade the antenna system on ISS during expedition #3 mission, with an antenna system specifically designed for the amateur radio bands. There are also tentative plans to upgrade the transceiver on ISS to a 50-watt class transceiver (pending many approvals).

For more information on this mission please check the NASA web pages.
http://spaceflight.nasa.gov/index-n.html

ISS ALPHA visibility:
The NASA web page has a program, which will calculate the potential for being able to visually see the ISS ALPHA as it passes over your city. They have a listings for many different cities and countries.
http://spaceflight.nasa.gov/realdata/sightings/

International Space Station Alpha Amateur Radio Call signs:
The ISS ALPHA is keeping the international flair by hosting several amateur radio call signs from around the world, and the list keeps growing. So far the ISS ALPHA has 4 calls signs from three different countries, Russia, USA and Germany. Also each of the crewmembers of expedition 1 has their own personal Amateur Radio call sign. One NASA engineer sent a message to the ISS crew saying, "You guys can use what ever [Amateur Radio] call sign you want".

William Shepherd, Expedition commander, KD5GSL
Yuri Gidzenko, Soyuz commander (pending)
Sergei Krikalev, flight engineer, U5MIR
Russian Module call sign: RZ3DZR
Other club call signs ISS used: RS0ISS, NA1SS and DL0ISS ALPHA

Suggested receiving station:
Casual listening for ISS ALPHA and Mir
2-meter vertical or scanner antenna (0 dBd or better)
Police scanner or amateur radio with the ability to receive in the 144 - 146 mc or MHz range, FM mode. Antenna cable should be a low loss RG-8 style cable less than 100 feet long (RG-213 best choice). You will not need to mount the antenna very high, just try to get above the roof ridgeline. And of course you will need to find / buy a satellite tracking program. I recommend the InstantTrack 1.5. It's a simple easy to use program, which can be purchased from Amsat.
http://www.amsat.org/amsat/instanttrack/

ISS ALPHA frequencies:
The Amateur Radio frequencies for ISS ALPHA have been posted.
Worldwide downlink for voice and packet: 145.800
Worldwide packet uplink: 145.990
Region 1 voice uplink: 145.200
Region 2 & 3 voice uplink: 144.490

You will need to dig out the manual for your radio and program in the following frequency combinations. Note that some of the older FM mobile and Walkie-talkie HT style radios over 15 years old may have some difficulty in saving these combinations into memory. The channels listed below will help you compensate for the speed of the space station, called Doppler. If the smallest channel step your radio supports is 5k, then only program in channels 2, 5 and 8. If your radio supports the smaller 2.5k channel step, then program in all channels listed. After you have determined your smallest channel step supported by your radio, then program in the channels. You can either use the procedures for storing ODD-Splits or you can reprogram your repeater off set for each of the channels and then save the new combination in a new memory location. This channel procedure has been successfully used on

the Mir Amateur Radio program for years and is the choice of usage for school schedules (you do not want to fiddle with VFO's during a 10-minute pass). I also recommend you program in all channels, no mater what part of the world you live in. The World Map ISS ALPHA location display used by the ISS ALPHA crew is not located next to the Amateur Radio station.

Voice operations Region 2 & 3 (North and South America and Pacific)
Chan Receive Transmit Offset (Meg)
1 145.802.5 144.487.5 -1.315
2 145.800.0 144.490.0 -1.310
3 145.798.5 144.492.5 -1.306

Packet operations Regions 1, 2 & 3 (Europe, North and South America and Pacific)
Chan Receive Transmit Offset (Meg)
4 145.802.5 145.987.5 +0.185
5 145.800.0 145.990.0 +0.190
6 145.798.5 145.992.5 +0.194

Voice operations Region 1 (Europe)
Chan Receive Transmit Offset (Meg)
7 145.802.5 145.197.5 -0.605
8 145.800.0 145.200.0 -0.600
9 145.798.5 145.202.5 -0.596

Usage Example:
Lets assume ISS ALPHA is approaching for a good 10 minute over head pass, running Packet. When ISS ALPHA comes over the horizon the Doppler frequency error will initially be 3.5k plus 145.990 = 145.993.5. This means the frequency ISS ALPHA will appear to be transmitting on is 145.993.5. Set your radio to channel #4 for the first 3 minutes of the pass. Then for the next 3 minutes use channel #5 and for the last three minutes use channel #6. Follow the same procedure for Voice operations. Since we are using the Mode FM, we do not have to have our Transmit and receive frequency exactly on frequency. We can be off frequency 1-2khz and still get reliable Voice and Data. The MAREX-NA team has been using this procedure for 10 years with excellent results.

QSL card:
A QSL card is a post card, which you can request to confirm you made a two-way or heard the crew on the Amateur Radio band. The QSL procedure for ISS ALPHA is under development, please check the AIRSS web pages for the latest updates and QSL procedures for ISS ALPHA.

Source record: 7801

http://www.arianespace.com/news_missionupdate.html

November 14 Special Report: Ground infrastructure anomaly results in
24-hour delay

Also see the press release for additional information.

An anomaly in the ground-based telemetry system at the Spaceport has
pushed back Arianespace's launch of Flight 135 by one day.

The anomaly was in the telemetry link between the ground control
network and PanAmSat's PAS-1R satellite, which is installed atop the Ariane
5.

Jean-Charles Vincent, the head of Arianespace's Kourou facility, said
the problem was pinpointed in the umbilical mast on the Ariane 5 mobile
launch table.

"We detected the anomaly this afternoon, and decided on the one day
postponement to provide sufficient time to resolve it," he said. "The
decision occurred before we began fuelling the cryogenic main stage with
liquid hydrogen and liquid oxygen propellant."

Vincent said both the launcher and its multi-satellite payload are in
a safe mode, enabling the countdown to begin again tomorrow. The launch
window remains the same as today: from opening at 10:07 p.m. to 11:03 p.m.
Kourou time.

Flight 135 will be the fourth commercial mission for the heavy-lift
Ariane 5, and the 10th Arianespace flight of this year. It marks the first
use of the no. 2 mobile launch table for Ariane 5, as well as the initial
flight with the ASAP 5 platform for auxiliary satellites.

PanAmSat's PAS-1R is the mission's primary payload. It is accompanied
by three auxiliary spacecraft: the British STRV-1c and 1d satellites, and
AMSAT P3-D.

We tend to think we're advanced, as humans. Yet we attempt to communicate with dogs, cats, monkeys, apes, dolphins, and god knows what....

If we found an amoeba on mars you can bet someone would want to try to communicate with it!

<snip>

Hmm. Wonder if anyone on Earth is hopefully transmitting an undersea beacon to be recognized by intelligent fish? Or into cattle feedlots to detect any sparks of bovine intelligence before they're extinguished? Although I'm not sure we humans would qualify as advanced beings, or even that we have much likelihood of predicting how such beings would behave, it might well involve some sort of "wu wei" or benign neglect of other lifeforms.

It is not frivolous at all! It is an important issue. I raised it earliar
too --- Imagine trying to get funding from Congress to communicate
with an ant! ...

>
> Would an advanced race of beings _bother_ to put any effort into
> communicating with what they would perceive as a "lower form of life"?

They may or may not. It depends. I'm sure, if they are out there
(supercivilizations), then they know about us via optical interferometry or
something very advanced like gravitational lensing, or something we can't
even imagine now. Soon even ourselves with NASA's terrestrial planet finder
missions we will start learning alot of details about the local stars with
planets
(looking for maybe even finding Earth like planets).

I think that there might be some point where a supercivilization might start
to
get "interested" in a lower civilization. I'm thinking I may not try to
communicate
with an ant or lizard, but maybe I'd start to get interested in a dog, or a
dolphin,
or whale, elephant, monkey, ...

>

Good questions.

What I worry about though is that there does not appear (appear) to be
any evidence, any sign, of extreme energy usage out there. No massive
or extreme technology. We'd notice it! Electromagnetic energy (the whole
spectrum from ELF to gamma rays) is how we know the universe. There

is nothing else really as fundamental as electromagnetic energy. We would not know the universe at all without it ...

Poul Anderson in an editorial on the SETI League web site talks about advanced civilizations becoming more stealth like in energy usage. This is sort of true for us now with spread spectrum, ..., etc. I don't believe it though.
A some point I'm sure we will occupy the entire Solar System which has vast resources capable of lasting (hopefully! :-( ) us millions or billions of
years. We would need to communicate across the entire Solar System. We'll need to use big energy (power) when we get to this stage of our development. I don't see how we can avoid it! There'd be big interplanetary comms and radars on all the planets probably. The interplanetary space ships would also
need to use radar and communications too across the solar sytem and into the Kuiper belt and beyond. I think it would need to be radio or microwave as it passes through us and is not noticeable (lasers might hurt or get blacked).
We'd be noticed! The bigger we grow the easier it will be to notice us by someone else far away. So we look out there now ourselves and we notice nothing unusual! Not yet anyway. Very curious! It seems like there really might be no one else out there. Myself? I want to keep looking. I'm suspicious
that they are really out there and we're missing something big .... I don't want
to leave any stones unturned ...

Al

PS: I'm late for work!

Wanted info and source code exemple for any sattracking on VisualB6 or VB5.

I ave on QBASIC or BASCI from original RUH source but, to many modifciation on the orbita kepler calculations forms with possible error...

Any ideo for to find a source code for traker on VB6?

Tnx for possible reply!

Tnx in advance also for all reply with the RUH first surce basic code... to many modifications on Function!!!

tnx for all possible reply!

They were definitely QSO's. The ops were passing grid squares. I haven't heard anything since.

Some one gave the link to a program called SatScape
i downloaded and installed it and it lists this info for the ISS:
Data for ISS (ZARYA)
(International Space Station)
Beacon: 628.000
Beacon: 632.000
Uplink: 139.208
Uplink: 121.750
Uplink: 231.000
Downlink: 143.625
Downlink: 130.167
Downlink: 247.000
Downlink: 463.000 & 436.000(TV)

Interesting?

Arianespace Flight 135 is Delayed 24 Hours
11/14/00
The launch of Arianespace Flight 135 has been postponed for one day
following an anomaly in the ground-based infrastructure at the Spaceport in
French Guiana. This anomaly, which affected the telemetry link with the
PAS-1R satellite, occurred during the final countdown on Nov. 14.
As a result, Flight 135 has been delayed for 24 hours. The launch
window is as follows:

a.. Kourou time: From 10:07 p.m. to 11:03 on November 15
b.. GMT: From 1:07 a.m. to 2:03 a.m. on November 16
c.. Paris time: From 2:07 a.m. to 3:03 a.m. on November 16
d.. Washington, D.C. time: From 8:07 p.m. to 9:03 p.m. on November
15

2861. Amateur radio on ISS status report

Newsgroup: rec.radio.amateur.space
Date: 2000-11-14 00:08:00 UTC

ARISS active on the ISS.
2000-11-13

With the successful execution of engineering test communications passes today, the Amateur Radio on the International Space Station project has passed a significant milestone. The initial two passes were through the Gagarin Cosmonaut Training Center (GCTC) ham shack R3K in Star City near Moscow. The control operator was Sergej Samburov, RV3DR. Eugene Labutin, RA3APR, was planned to address the crew. Also, Vladimir Zagainov, UA3DKR, was in the ham shack. Sergej is the Russian delegate to the ARISS team. Eugene is the AMSAT Russia president. Eugene is continuing a family tradition, as his father made the inaugural contacts with the Mir ham radio station. Vladimir is in charge of training at the GCTC.

A subsequent test pass through the NN1SS station at the Goddard Space Flight Center (Greenbelt, MD) was equally successful. Engineering tests with the packet rig still need to be organized.

The crew, while still very busy, expressed their interest and support of amateur radio activities on the ISS. It seems likely that over the next few weeks, as the crew's schedule settles out, that we may be able to look forward to more amateur radio activity from humanity's latest foothold in space.

The ARISS web pages at http://ariss.gsfc.nasa.gov/ are the best place to check for current information on the status of amateur radio operations on the ISS.

> (except for the Russian thing) ;-)

If you monitor 143.625, at least you will know when the bird is
within range. Usually, the beacon frequency will not have voice
on it. The actual frequency that you can expect to hear people
on is 145.800 MHz. The frequency of 144.900 MHz is the frequency
people on the ground use to communicate to the space craft. Not
much sense listening on that one, because you will only hear ground
stations close to your location.

> Should we scan 144.900 and 145.800 too?

No, just 145.800 for the reason I stated above. By the way. I am no
expert, have not talked with the bird, just relaying info that was
told to me.

I am looking for the hardware specs for the Kansas City Tracker. I have seen a file listed in the InstaTrack Utilities called KCTHW.txt. I can not find this file for download anywhere, where I can find the files on the disk everywhere! If anyone has this file on their utilites disk could you please send me a copy?

Specifcally, I have an AEA-ST-1 interface and I am looking to write software for it! The spcecs say that it should work with KCT software. I am able to get the port to rotate the antennas but I cannot read their position. It looks like I have to strobe the ADC about 8 times then drop enable the CS line for 17 micro secs then strobe-n-read a bit at a time. This seems strange to me since I have a perfectly good data line. This must have been developed for the old one way parallel ports.

This is the ground comms, not a beacon.

>The actual frequency that you can expect to hear people
> on is 145.800 MHz.

If they are operating the Ham station. If not you need to listen to 143.625

>The frequency of 144.900 MHz is the frequency
> people on the ground use to communicate to the space craft.

Only Hams.

No listen to 145.80 if you feel they are active on the Ham radio station.
Listen to 143.625 if they are woking.

It may sound frivolous at first, but my question raises an important
issue.

Would an advanced race of beings _bother_ to put any effort into
communicating with what they would perceive as a "lower form of life"?

Hopefully, their advancement hasn't moved their technology beyond out
current SETI theories. (radio, optical etc.) If, on the other hand,
"supercivilizations" no longer have a need for radio and optical means
of communication, (Perhaps the "radio age" is comparatively short
during the evolution of a species.) there is a real possibility that
they would not bother to resurrect it just to talk to the "lizards".

Hopefully not, but I can't help wondering...

How about you take a look through Amsat

Their main webpage is located @ http://www.amsat.org/

I also took a moment to find the area that they house the Linux software
that they do carry is located @
http://www.amsat.org/amsat/ftpsoft.html#linux

Just thought that I would give you a hand in locating the software that you
were looking for!

The American crew member believed it would be tempting bad luck to inhabit
a space station without a name. So he proposed a name during the radio
contact that occurred just after docking.

Unfortunately (IMO) he again came back to the name Alpha which was
suggested by NASA before, and which was rejected by the Russians because it
suggested that it was the first space station (because Alpha is the first
letter in the greek alphabet). The Russians counterproposed the name Beta
at that time, which was not accepted by NASA.

I think it is not very polite to bring forward the name Alpha again, in the
presence of the Russian crew and groundstation personnel, by the
American astronaut. It was accepted by the English speaking groundstation
personnel "for this mission only". But the Russians most likely felt stept
on their toes.

This should have been solved by mutual agreement. And if he wanted a name
so badly, he should have come up with something original, not a name that
was rejected before.

Rob

I know that red hat comes with allot of Ham Radio stuff. You just have to
specify it in the setup

Gee, if the Russians don't like Alpha, how about "Freedom", that was Regan's name for it? Or, considering the problems on the Russian end, maybe "Cheop" after Cheop's Law: "Nothing ever gets built on time, or within budget". Every name you can come up with will offend somebody, and NASA is terminally afraid of offending anybody that might complain to their congressman. That's how we ended up with "ISS", which isn't a word. Just be glad they didn't go with "American Space Station". ;<)

I don't see the problem with just calling it "the international space station" ?, it's what most people have been calling it for ages now and it was widely accepted by all. After all it is an "international" thing really.

Why has something always got to have a cheesy name like "freeedom" or "alpha"...too much star trek or something :-).

PS.

What we should really worry about is that this station better come up with results that the GENRAL PUBLIC at large can see making a difference in their lives or you can forget the future of space science/travel because nobody will stomach another financial outlay like that again if it does not produce results that everyone can benefit from in day to day life.

And I really don't think velcrose or the amazing ability to take a crap while sitting upside down relative to the Earth will cut the ice this time :-).

Dreams: All people in the world have dreams.
Every one haves bad dreams, good dreams, weird dreams, and Unknown
dreams that don't make sence..

But why do we have dreams?????????????
why did God made dreams?????????????
Did Jesus Yous to have Dreams?????????

to me dreams are just A diffrent world.,
Dreams are real!!!.. Dreams are stronger then real li□e because you
can do anything you want in our dreams....

Alot of people say dreams aint real.. its all in the mind!!....but who
said A mind aint real?

Dreams come from our minds, so if your saying
dreams aint real, then is are mind aint real?

Dreams is A other world., thats trapped in are head!!!.. all our
Imagination's and feelings and everything we think about is in our
dreams..

Either its Bad or good, or weird or unknown..
dreams are REAL!! its A diffrent world.

A world where you can do anything that the humen mind can Possibly think
of....

People say:

"At night when we go to bed, we done what we had to do in our day, now
its time so shut our eyes and go to sleep and get ready for the next
day"

Well to me this is how I think of it:

"at night when we done what we had to do in This World!! that calls
earth, now its time to close our eyes and go to A diffrent world where
all our Imagination's go wild and do anything they want"...

Now tell me this:.. "do you think Dreams are real?"......

Please respond back!!!... (-:

Java Based.. Lets you track all the sats in realtime or rt x 100(0). It is very cool. I've never seen anything quite like it. It is web based so it always has the latest kep data.

Sent via Deja.com http://www.deja.com/
Before you buy.

Below is the estimated State Vector and Keplerian Elements for
the AMSAT Phase 3D spacecraft. The vector data was computed from
Arianespace orbital parameters at the time Phase 3D is scheduled
to separate from the Ariane 5 upper stage. The Keplerian Elements
were computed, in turn, from the vector.

Vector format = 10107
Satellite Name: Phase 3D
Catalog Number: 93400
Epoch MET: 0.02983772000
0/00:42:57.979 MET
EFG E: 4321.19714449000 km
F: 10857.0727900300 km
G: -1323.5057345899 km
Edot: -3.1484853319000 km/s
Fdot: 5.75560664520000 km/s
Gdot: -0.5488001613000 km/s
ndot/2 (drag): 0.00000000771 rev/day^2
nddt/6: 0.00000E+00 rev/day^3
Bstar: 1.25668E-05 1/Earth Radii
Elset #: 1
Rev @ Epoch: 1.52588079822

Launch Window Opens: 2000-NOV-16 / 0107 UTC
Phase 3D separation: Launch + 0042:57.979

The following Keplerian elements were computed from this vector and
the scheduled date and time of the launch window opening. Updated
Keplerian elements will be computed from the vector, based on changes
to the scheduled or actual launch time.

Phase 3D
1 93400U 321.07636550 .00000001 00000-0 12567-4 0 14
2 93400 6.5034 247.6325 7357988 175.9296 13.3886 2.02435417 19

Satellite: Phase 3D
Catalog number: 93400
Epoch time: 321.07636550
Element set: 1
Inclination: 6.5034 deg
RA of node: 247.6325 deg
Eccentricity: 0.7357988

Arg of perigee: 175.9296 deg
Mean anomaly: 13.3886 deg
Mean motion: 2.02435417 rev/day
Decay rate: 7.71000e-09 rev/day^2
Epoch rev: 1
Checksum: 276

Note that "93400" is a temporary Catalog Number. A Permanent Catalog Number and International Designator will be assigned when Phase 3D is launched. The satellite name will also be updated with the next sequential "OSCAR" designator.

These Keplerian elements represent a pre-launch estimate of Phase 3D's initial orbit. The orbit will change significantly over the first year the spacecraft is on orbit. Updates will be provided for significant orbital changes.

When did anybody start calling it ALPHA again?, I thought that name was
dropped ages ago for simply "the international space station"

curious

ian

ps: i note in the other thread you are up awaiting arianne launch...me too
shame about delay :-(.

2884. Ham software for linux? (was: Re: ISS on 143.625)

Newsgroup: rec.radio.amateur.space
Date: 2000-11-15 05:39:31 UTC
From: Eric Oyen <n7zzt@home.com>
Message-ID: <3A1221A1.FCCFC20A@home.com>
Source record: 7806
Cross-posted to: rec.radio.scanner,rec.radio.amateur.space,rec.radio.amateur.misc,alt.ham-radio.vhf-uhf

big question?
is any of the software (thats so useful in windows) have a
linux equivalent? It would be nice to be able to have fft capabilities
in linux using the same hardware you find on a winblows box (and
space tracking would certanly be a plus as well).

thanks.

apparently it will take up to 270 days before it reaches is proper orbit !!.

you may have to wait a while before you can "really" use it.:-)

Subject: [amsat-bb] P3D 400bps PSK beacon

12:45z on Nov.16, JN1GKZ Masahiro heard the very loud long for 400bpsPSK
sound on 145.900, must be from P3D.
Then Imaishi JF6BCC, Masaji JH3BUM, Katsumi JH0TOG/9, Jun-ichi JH5AKH
reported also on JAMSAT list. Several minutes after 10z it got LOS in
JAPAN.

Anyway, Congraturations!

From: Eavesdropper <ian@eavesdropper.worldonline.co.uk>
Message-ID: <3a143735@news.server.worldonline.co.uk>
Source record: 7835

Heard on the news today theRussian Gov has said that MIR is set to be de-orbited between Feb 26th and 28th over an area near Australia with a minor risk of some debris hitting ground.

About time too, maybe if they had done this earlier the ISS would notbe so delayed!.

Oh well, bye MIR she done a good job !

I would personally reccomend Nova for windows, there are many to choose from
if it is a free one you want try Winorbit that is quite capable.

do a search on the web and read.

2900. ISS and Sunsat Frequencies needed

Newsgroup: rec.radio.amateur.space
Date: 2000-11-16 00:00:00 UTC
From: sbcmusic@aol.com
Message-ID: <20001116180704.22455.00000279@ng-ff1.aol.com>
Source record: 7838

Hi, all, for some reason tonight I can't access the web, although I can access Email and newsgroups......that's the reason for my post, otherwise I'd go to amsat.org and get it......

I need the uplink and downlink frequencies for ISS and Sunsat.....I'm leaving for the Great Smoky Mountains in the mornings and would like to have the info before I head out......I'm anxious to see how a 6,000 foot antenna helps with satellites :)))

I guess AO27 and 14 would help too :)))

Thanks, y'all
Rick N9GSU

I'm going to Miss MIR. I spent Many nights up into the wee hours of the
morning trying to contact her. Those were the days.

November 17, 2000
Russia to de-orbit Mir in February
American tourist Tito will not fly to station

By Jim Heintz
Associated Press Writer
MOSCOW (AP) -- Russia's Cabinet decided Thursday that the space station Mir will end its 15 years of pioneering achievements and white-knuckle mishaps with a fiery plunge into the Pacific Ocean in February.

Mir's successes and tribulations mirrored the epochal changes that shook Russia during its time aloft, and ditching it in a remote corner of the sea 900 to 1,200 miles off Australia will extinguish a potent symbol for many Russians.

But Mir is deteriorating, foreign investors who bought the station an eleventh-hour reprieve this year haven't met their commitments, and Russia wants to concentrate its revenues on the 16-nation international space station, which received its first crew last month, Russian Space Agency chief
Yuri Koptev said.

Koptev said it would be unsafe to leave Mir aloft without new, expensive missions to refurbish it.

"This year has already been rich with disasters," he said. "We must not encourage new attacks and speculations aimed against our country."

Russia's one-time image of technological prowess was severely tarnished this year by the sinking of the nuclear submarine Kursk and the fire that engulfed
Moscow's TV tower, one of the world's tallest structures.

Russia also was embarrassed by the funding problems that caused it to fall years behind in launching a key module of the NASA-led international space station. But its launch this summer, followed by the station's first Russian-American crew arriving in a Russian space capsule, has restored some of Russia's pride.

For years, NASA has been urging Russia to concentrate its funds on the international project.

"Our concern has only been that the Russians have adequate resources to support their commitments to the international space station," NASA spokeswoman Debra Rahn said Thursday at the space agency's Washington headquarters.

"We've always said the decisions on Mir are the sole purview of the Russian government," she said.

When Mir was launched Feb. 20, 1986, it was the epitome of achievement for the Soviet Union, which had already launched the world's first satellite and put both the first man and first woman in orbit.

The first of a series of mishaps that were to bedevil Mir took place only a year later: the station's second module, Kvant 1, was unable to link up because of an "alien object" blocking the docking port. The object, later reported to be a plastic bag, was removed during an unscheduled spacewalk by the crew.

In 1991, an unmanned cargo ship lost control during its approach to Mir and nearly smashed into it. Over the next few years, the station ran smoothly even if the Soviet Union didn't. Cosmonaut Sergei Krikalev got the unusual distinction of being a Soviet citizen when he blasted off in 1991 and a Russian citizen when he returned in 1992.

Cosmonaut Valeri Polyakov set a space endurance record by staying aboard for 438 days in 1994-95.

But 1997 changed Mir's image to a space jalopy. An oxygen-generating canister
burst into flames, nearly forcing the crew to abandon ship. A cargo ship rammed Mir, piercing one of the modules and forcing the crew to seal it off before too much air leaked out. Computers failed twice, and the station went adrift after a cosmonaut inadvertently disconnected a power plug.

In 1999, Russia said it lacked the money to keep Mir aloft and planned to ditch it over the winter. But the private, Netherlands-based MirCorp leased time on Mir and promised to pay for its operation.

While MirCorp financed a mission to Mir earlier this year, it has failed to meet other commitments, forcing the government to divert funds intended for the international station, Koptev said.

"We cannot continue this game ... which I call Russian roulette. We simply don't have the right to do that, because we are a government agency responsible for the safety of Mir," he said.

American businessman Dennis Tito, who had hoped to travel to Mir as a "space tourist" under a deal with MirCorp and has already spent $1 million in training, will not be sent to the station, Koptev said.

MirCorp representatives did not respond to telephone messages seeking comment.

The company, which said the space station had wide commercial potential, had said it aimed to raise about $120 million through a stock offering next year,
but Koptev indicated Thursday's decision to bring Mir down would not be reversed even if new money appeared.

Prime Minister Mikhail Kasyanov told Thursday's Cabinet meeting that safely discarding Mir is an international commitment for Russia.

A Soviet satellite crashed into northern Canada in 1978, scattering radioactive fragments over a wide area. A year later, the unoccupied U.S. Skylab space station fell to Earth when its orbit deteriorated faster than expected, scattering debris over western Australia. No one was hurt in either
incident.

Koptev said an unmanned cargo ship would be sent to Mir in January and in February the cargo ship would fire its rockets to push the station quickly into the atmosphere.

Source record: 7752
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.space,rec.radio.amateur.misc

I've started using RecAll to catch whatever I can. That's a voice-activated recording program for Windows. I leave the scanner on, set to 143.625, connected to the PC, with RecAll running. One hint, though -- disable the power down mode of your PC. I discovered that the sound card powers down, too, and nothing gets recorded. Duh.

Question for those who know: If I'm using a stock scanner, with either the rubber duck or a extendable antenna, am I better to place the antenna horizontally so it receives from "up there"? I'm thinking I should lay it along a north/south axis, so it will receive from the east to west horizon. Thoughts?

Gerry

Can't say I am sorry about Mr. Tito losing his chance to go on Mir thats one
less person in space who is merely trying to "buy" there way there instead
of working it like others have to.

Maybe one little spoke in the wheel of corporate exploitation of space it
has been proved too many times that they only damage things here on Earth
best they leave space alone.

Just my opinion.

Actually Tito worked on the Mariner missions and has a science
background from what I've read. He could do work. He hopes to be going
to the ISS instead in April but who knows.

The current keps seem to produce REALLY wierd tracks. It's hard to tell, given flat-map distortions, whether or not they plot correctly (to me, at least).

At the moment, the track comes along west-to-east close to the equator, then zig-zags northward slightly and heads off over Africa.

I've definitely never seen a satellite track like that, and I don't see how the "zig-zag" can be for real. Even with the distortion of projecting the globe onto a flat surface, this can't be the actual track of AO-40.

I'm looking at WinOrbit, since the websites have not updated, to view the tracking. I'd like another opinion, in the event it is WinOrbit that is confused (instead of ME).

By the way, http://www.heavens-above.com seemed to be "gone" last night.

This is a highly elliptical orbit with a small inclination. Just the
standard geostationary transfer orbit for a launch from Kourou. When you
have not seen a track like that, you simply have not looked at too many of
them...

The zig-zag is of course caused by the relative speeds of the satellite in
its orbit and the earth revolving around its axis.

I agree, the track is really different than what we're used to seeing. But it's just because of the elliptical orbit and it is correct. The neat thing to watch is how long it hangs over North America. Many hours of fun possible. The tracks are different than we're used to seeing because most all of the sats launched thus far have been in relatively circular orbits compared to AO-40.

Regards,

Casey

2921. Re: Satelite Tracking for X Windows

Newsgroup: rec.radio.amateur.space
Date: 2000-11-17 00:00:00 UTC
From: Ken Harris <KHarri4@attglobal.net>
Message-ID: <3A15A344.28C5E00F@attglobal.net>
Source record: 7761

David Findlay wrote:
>
> I saw the thread about non-x sattrackers, but are there any really good
> satelite tracking programs for Linux with X, preferably using OpenGL for
> graphics?

I can't pretend to know what "really good" is, but this program uses
OpenGL and Linux to display the current positions of satellites:

http://www.qsl.net/kf6hxx/cosmic/cosmo.gz

Executeable expects "libstdc++" DSO library

Random list of features:

It expects "elements" on standard input.
Get elements from http://celestrak.com/NORAD/elements
Uses "SGP" model for satellite prediction
It displays the sun vector and solar terminator and lights the globe.
It displays the coast lines of the continents.
Some UI:
right mouse button and mouse movement will change eye point
left mouse button pops up menu to select "field of view"
- : decrease field of view (zoom in)
+ : increase field of view (zoom out)
s : toggle "smooth lines"
l : toggle lighting model
c : toggle display of coastlines
p : "pick" : prints info about satellite that cursor is near

History: this code was originally written on an SGI machine using
"Classic GL",
then ported to OpenGL and Windoze (it lost a few features in the
process,
like stereo viewing). I used "IFL" to read image files for texture
mapping the
earth on SGI and Windoze, but that library doesn't exist on Linux (to my
knowledge),
so there is no texture mapping.

2922. pager vs Meteor 3-5

Hello
A very strong pager signal has begun on exactly the 137.3 MHz frequency
of Meteor 3-5 here west of Seattle.
Is this legal? Is there anything I can do about it?
Dale

If this is the case then Tom then that's OK, providing he serves a good use
then thats fine, as their are many people who work for years and years to
get there, frankly it would revolt me to see someone getting there on the
back of money.

Simple. take alook around you Tom and see what a slag whore dump that the
corporate business people have made of this planet !, the future of space
should be entirly HUMAN based with no room for profit makers and or any kind
of profiteering body. I don't know about you but I am sick to death of
seeing all the bullshit that surrounds this planet. It would be nice to see
that things of a space nature would be a "fresh start" for all of humankind
to develope from and not just another platform for the money hungry whores
of this world to breed more of the same.

I must agree on this fact, I know that the power to take something ike MIR into an escape velocity situation would be quite great but surely it could serve a purpoes especially as it is so large compared to a satellit. There must be some use for it. ?

Why in the name of god that did not make this to be compatible with a standard radio modem or hamcomm type interface i do not know, to me it does show a lack of thinking, in respect of the fact that most of the people into this scene either have already a hamcomm interface or a packet modem. This whole scene needs to get an "industry standard" of some kind based on what the majority of users already have, if the hobby/passion is to be carried on this would surely serve as a good way of helping people to stay with it and not to excluse those who cannot afford to buy yet MORE interfaces/modems /software.

we need compatability somewhere

ian k.

Rather strange I think

Source record: 7769

Regarding "standard" AO-40 baud rates, a few facts regarding the use of 400 baud would be useful. First of all the system was designed in 1981----long before any other ham type mass marketed device was available. The selection of that baud rate was based on as fast as TOTAL SYSTEM requirements would allow. These were many and complex as I had a devil of time following G3RUH who first designed a suitable hardware modem. The satellite in mind then was OSCAR ten launched in Mid 1983. Ham radio showed the rest of the world what was possible not the other way around. The 400 baud works today, thank you, on AO-40 (phase IIID) as it did on AO-10 and AO-13. The downlink is standard ASCII with an infinite number of stop bits so most any "standard" baud rate you might require will work just fine! My original G3RUH hardware modem set up for use with the Commodore 64 is downloading AO-40 marvelously. All we need now is a program using the sound card or EVM evaluation board to bring the system to "modern!" 73 to all and congratulations to AMSAT members everywhere.

I downloaded the AO-40 keps from Amsat (http://www.amsat.org) and they are fine. The telemetry on 145.897 could be heard (very strong) at AOS and it promptly disappeared at LOS. What a joy to hear the S5 signal for most of the day! The 9 months until it is fully operational will allow me the time I need to get my sat antennas purchased and installed.

> K5MBV

You will have to tune around that frequency to compensate for the Doppler shift and _AO-40 will have to be in range_.
At the time of this post (18 NOV-0423 UTC), AO-40 is located above Asia.
For my ground coordinate in Southwestern British Columbia , AOS will occur 1308 UTC and LOS won't occur until around 2400 UTC. This is around 10 hours!!! of acquisition time.
The signal on 145.897 is not really a beacon but is PSK data giving ground control stations telemetry of the bird's status.

Cheers,

John (VE7JDB)

Looking for the technical link parameters for FO and RS satellites.
Meaning, G/T required for the downlink and ERP for the uplink.
I was surprised at how many places I had to look for this info for
P3-D before I found it (in the '99 ARRL Handbook); I would have
thought that this info would be de rigeur for any satellite.
But I am new to this (ham-wise, at least)...
Thanks

The uplink ERP is in various AMSAT publications, like the Easy
Sats book. As for downlink G/T, I wasn't aware the FO or RS
satellites had ever been characterized this way. Perhaps you
would like to measure them and report the results?

One little correction, Rob. Both Russian and American crews have been
lobbying for this very name for several years. In the weeks leading up
to Exp 1 launch, the only question here at JSC was how long they'd wait
to start using, and whether they'd ask or tell the ground.

It's only the RAKA and Energia managment that doesn't like Alpha.

The crews feel it's very fitting - the first international space
station.
(anyway, if you're counting all Russian space stations, this would be
eta or theta).

From: Chris Muir <cmuir@startrek.org.nz>
Message-ID: <SXdR5.3487$gVqd.59244724@news.xtra.co.nz>
Source record: 7773

Is anyone working on soundblaster based software decoder for P3D telemetry?

Is this feasible? There are so many fantastic soundblaster based software offerings around now for ham HF digital modes I would have thought a software package using the soundblaster instead of a hardware modem might be the way to go!

Because an existing and reliable system was available.
Remember that most people with a need to have a telemetry system already
had one available. Sure you can design a new system, but what would you
have done differently? Use 1200 baud AFSK on an FM carrier?

The satellite was, even though that is 5 years ago by now, designed and
built under a tight schedule. I think it is very reasonable to use
systems that are readily available and have been proven in orbit.
The fact that the launch was delayed so many times does not affect the
initial design decisions, of course. But IHU-2 was added later, so at
least you can't complain about the use of a seventies microprocessor for
the IHU.

>Well, I cannot be accused of no effort on the decode front as you may know I

>should have been very easy !, I think the lack of thinking was on the
>designers part in not allowing some time within the last TEN years to make
>something so the whole community can join in on the telem side aswell.

What you don't realize is that there is a small (elite?) group of people
who do the real designing and building, and they are not interested in what
you propose. Others may be interested but they won't build anything, they
rather wait until they can download it.

SP9VRC has written a DSP implementation of the modem years ago, I can
run it here on my DSPcard4 when I like. But I first need to wait for
a suitable pass, which will take a couple of days (shielded to the
southeast, so need a southwest view, apogee over the atlantic).

The French program comes without source, so that is no useful building
block. Else I might have converted it to Linux.
(it runs under dosemu, though)

Not interested, well that in my book say's a lot about the WRONG attitude, and supports directly my point, obviously with THAT attitude Amsat does not need any more members or financial contributions or assistance.

Can I take it that is an official stance of Amsat then Rob as you are a member?, because if it is it is a very stupid one, as Amsat worldwide needs people if they are to carry on and make bigger and better things, why are they so quick to scorn attempts at help ?.

I cannot tell you how dissapointed I am at that statement, I am the sort of guy who would give up a lot to help towards a project if the people are also willing and friendly. I have only just now invested in more equipement to make things really nice for working the ISS and Sats , now I am looking at it all thinking why did I bother, what's the point when people have that outlook on things...might just as well buy a cellphone and say stuff it !.

your's dissapointed

ian k.

2943. AO-40 telemetry decoder?

AO-40 has a great telemetry beacon - very strong here right now,
and the bird's about 39,000 miles away!

I was wondering if anyone has a decoder program for it that uses
a windows sound card? I don't have the modem needed for Chris
Jackson's program.

Thanks,

Greg.

No, not at all. I am just describing the general situation in radio
amateurism, where there is a small group of people actively developing new
stuff, but with limited time and (of course) limited interest. And a very
large group that only wants to copy, wants zero investment in hardware,
and wants everything at the least possible cost.

This is not specific to Amsat, and my statement is not representing Amsat
at all. It happens everywhere. Look at packet radio, for example.

Chris

Not found one yet but the uk amsat website does mention that amsat-france are working on a soundblaster version, to quote the website

"AMSAT-F is also developping a Windows version which should be available in the next few days. This program, uses a FFT display and will allow an easy tuning of the center frequency. The program is intended to convert audio PSK streams into binary files."

Hope this helps

Yes, Tom is right. The money that would be required to keep MIR in state
of usablity would be best used to support ISS activities. Russia has severe
problems with financing it's currently operational comsats, wxsats etc as
well. So sad to say MIR has to be axed from the buget, the planned activity
by a commercial concern may in part be done on the ISS.

"all of the sats launched thus far"? You probably mean amateur satellites,
but even then the orbit of AO-13 was much more elliptical in the later
years of its life.

Of course the AO-40 orbit will be made a bit more circular, and the
inclination will be increased (so the zig-zag will occur above a more
northern latitude).

But this orbit should not look strange. It is like AO-10 and AO-13, and it
is what has been published about so many times.

>/software.

It shows a lot more lack of thinking to complain about this in the way you
do above, without first reading about- and considering the design
objectives of the system.

The AO-40 telemetry system was designed to be a reliable downlink system
for telemetry (and command feedback) within the limitations of power
output, path loss, etc. It was not designed as a newspaper for every ham
on earth to read with his 741 dataslicer on the COM port.

Don't confuse the telemetry channel with a transponder. The telemetry
format is open so you can have a look at it, but it is not the prime
purpose of the satellite that every ham on earth will be looking at the
telemetry.

Even then, it would be possible to demodulate it with a sound card program.
The fact that it is not readily available in bells-and-wistles form ready
for the casual listener that will look 15 seconds and then discard it
should be pretty obvious. Not many people (including yourself) will spend
the coding effort for fame lasting that short.

The people involved in the space business, especially those most likely
to make personal trips to space, are all privileged. To suggest that
they "work their way" is nonsense, and anything which undermines the
state's monopoly and opens it up to more people can only be beneficial.

>Simple. take alook around you Tom and see what a slag whore dump that the
>corporate business people have made of this planet !, the future of space
>should be entirly HUMAN based with no room for profit makers and or any kind
>of profiteering body. I don't know about you but I am sick to death of

>that things of a space nature would be a "fresh start" for all of humankind
>to develope from and not just another platform for the money hungry whores
>of this world to breed more of the same.

One of the beauties about space is that we have the potential to do
whatever we like there. If one is going to argue that space can be
"polluted" then anything human is a pollutant.

The worst bullshit surrounding the space business comes from those who
use it as little more than a job creation scheme for bureaucrats and
second-rate academics. That was what killed the Apollo program and it's
what's holding back space exploration now.

> on earth to read with his 741 dataslicer on the COM port.

Path loss ?, I am often working l and S-band space comms monitoring now that
is lossy vhf is nowhere near as bad and I thought the whole point of the
satellite was for use by hams in all respects.
>
> Don't confuse the telemetry channel with a transponder. The telemetry

> telemetry.

I am quite aware of the difference between telem and transponders, my point
is that why do we all stick with the same old systems ?, surely the whole
point is experimentation and developement ?. Why was a newer and faster
system not developed ?.

> --
Well, I cannot be accused of no effort on the decode front as you may know I
ran Eavesdroppers for some years and I put a LOT of effort into getting
decoders made with no return to me and to be honestr a lot of idiots
complaining and not helping to IMPROVE the systems, frankly there is source
code around for this format and getting into a sound carded windows platform
should have been very easy !, I think the lack of thinking was on the
designers part in not allowing some time within the last TEN years to make
something so the whole community can join in on the telem side aswell.

And to show I am not just complaining I will try to get hold of an old programming friend who helped me make winflex a few times and I will see what I can do to make a free telemetry decoder for P3D athat works on a sound card nice and simple like.

Thankfully I do not suffer from "I made this therefore you must bow to me" syndrome and do not give a sod about any of that, can't make no promises but I will do my best.

I will see what I can do...now wheres that source code.....

regards

ian k.

In addition to the beacon, there was also some SSB (USB) activity around 145.9. just a few minutes ago (0015 UTC) Stupid me, I did not write down the callsign I heard - w0 something - and he was talking about being on a satellite.

I'm new to this satellite stuff, so I'm confused as to what I heard. Either this was AO-40 or (maybe) AO-10.

Anyone - clue me in!

thanks

Chris,

Go to http://www.ccr.jussieu.fr/physio/amsat-france/index.htm and
click on WPSKDEC in the center of the screen. Fill in the form with
your information, and you can then download a program which will do
what you wish. A little rough right now, and it helps if you can read
French, but it works.

If you want software, perhaps you should start writing some?

BPSK is easy to demodulate. Look at the source code for any
PSK31 program.

for those who cannot read frenchand download this here is a quick translation of the text file that comes with it...Unfortunately it is dos and NOT REAL TIM it works by decoding a wav file of pre-recorded telem. But it is a start and good for them. !!

ian k.

******* SOFTWARE OF DEMODULATION AND DECODAGE TELEMETERINGS PHASE 3CD ******** * THIS TWO SOFTWARE IS THE PROPERTY OF AMSAT-FRANCE. * THEY ARE IN VERSION LIMITEE AND AMSAT FRANCE CANNOT BE RESPONSIBLE FOR THE CONSEQUENCES OF * THEIR USE. 1-CONTENU OF THE ZIP. PSKDEM.EXE TLMDEC.EXE P3D.WAV / / recording of the telemetering of p3d in Kourou, TX Laser (1 frame) P3DTLM1.WAV / / enreg of the tlm during the tests of the ihu2 in 1999. (3 frames) 2-DESCRIPTION. The telemetering of Phase 3D can be transmitted with various modes of which more employed is a phase modulation coded out of Manchester differential. This description treats only the latter. The normal frame of telemetering consists of approximately 130 natures ' P' of synchronization character followed of a word of locking of frame of 4 bytes then of 512 characters and to finish of a CRC 16 out of two bytes. The following frame repeats this reason. The length of frame is of (130+4+512+4)*8/400 = 12.96 seconds. The frame includes/understands 256 ASCII characters follow-ups of 256 binary values. Once modulated, the signal has the appearance of that shown on modemploi.bmp. The carrying one is removed and surrounded by two arches, the unit occupying approximately 1600 Hz. With the reception, it is advisable to use the BLU and to fix the receiver so that the signal is not truncated, i.e. to place the centre frequency between 1200 and 1800 Hz. The demodulator provided by G3RUH imposes 1583Hz because of its constitution (adjustable by riders at other frequencies). 3-LOGICIELS. 3.1-INSTALATION. To create a repertory and all d&#65533;zippzer. It is highly desirable to have a software like CoolEdit or Spectrogram. 3.2-DEMODULATION. Program PSKDEM.EXE is a demodulator not real time functioning under DOS. It utilse of files WAV recorded using the Windows tape recorder or all other software allowing to record files sound. The file must be recorded with the following parameters: - format PCM

Dale,
This sounds like it might actually be an "image" reception of a 158 MHz paging freq. Check the I.F. frequency of your receiver, commonly 10.7 or 10.8 MHz, and double it, add that to 137.3 MHz, then scan in that frequency range. I bet you'll find your offending paging service. Paging services have to use powerful transmitters, and if you are using a broadband receiver, it's front end just isn't capable of blocking out the signal. PAR electronics make an excellent notch filter for the 158 MHz pagers, knocks them right out. Grove Enterprises, www.grove-ent.com carries them, as do other radio dealers. I use one myself, and it really does the trick.

There is always some confusion about object designators just after launch,
it now looks as if it has been assigned 2000-72B, catalog number 26609.

Can any of you tell me what this has to do with
rec.radio.amateur.space. The signal-to-noise
ratio here is low enough. Please take this to
policy or alt.radio.amateur.

Did you check the relevant websites first?

BTW, it looks like KA9Q (an expert in the field) is going to write a
modem. Probably not a decoder, but it already exists: P3T.EXE

Hi

Looking for recommendations on a "beginner"s to advance" tutorial for Linux / Unix preferably a pdf file that was intended to be read from beginning to end (not a help or reference manual).

I have seen a lot of them out there and the problem is to choose one and start learning, I can"t read them all.

So far I got:
RUTE USERS TUTORIAL by Paul Sheer
and
UNIX IS A FOUR LETTER WORD AND Vi IS A TWO LETTER ABBREVIATION by Christopher C. Taylor.
Both look good and I"m awaiting your recommendations.

THNX, Jeff

2989. Sat Ops question (sort of specific to FO-sats)

Message-ID: <3a177278.59007875@news.primenet.com>
Source record: 7675

OK, got it all setup and I can actually hear myself (which is pretty
cool all by itself...)
Calling CQ seems easy, just call, find yourself, and listen, right?
Or not right?
And how do you answer a CQ? Guesstimate the TX freq and adjust until
you hear your reply to the station calling? Or is there a better way?
I seem to be adjusting a lot of dials very quickly, so far I have had
no results but that could be other issues.
Thanks, hope to actually work someone on FO-20 or FO-29 here soon!

I'm a bit confused here...
The signal is 400 bps PSK telemetry, which is "data" transmission.
You would normally use SSB mode on your receiver to receive this
signal, and demodulate it in a separate modem (see the thread(s)
about software demodulators).

You can't use FM to demodulate this kind of signal, but you should
be able to hear a "whizz" in FM-mode (an increase in the noise)
when tuning over the telemetry channel.

It is normal to copy this telemetry using SSB.

Well, when it is not too strong in SSB you won't hear a thing on FM...
especially when you don't anticipate it being there.

"proof": when I was trying to listen last sunday, I heard a distant FM
QSO on 145.900 MHz. I could not find out who it was, and if they were
trying to work over a satellite. It did, however, sound like a
sunday-afternoon local chat. I'm afraid stations like that won't notice
the telemetry at all.

Yes. I did it yesterday afternoon (2315 UTC, IC-202 and a
dipole, range about 15000 km).

What you are in fact doing is shifting the frequency of a
145.9 MHz BPSK signal to audio with a tunable downconverter.
This is what SSB radios do.

You could demodulate the VHF signal directly. In view
of the ease of downconverting it to audio, this would
be far more trouble than it's worth.

Glad to hear another op on the FO birds. They are real nice, just
under utilized. Anyhow, calling CQ in the way you describe is just
fine. After the CQ, tune around +/- 10 KHz of your downlink freq for
answers. Some guys with humble stations (like me) may not be right on.

Message-ID: <rq3l1t4pon1ab1s5dfsdhvk5ipn9veb9nm@4ax.com>
Source record: 7692

Chris,

Make certain AWLEN is set to 8. This will be needed for P3T. At the command prompt, type DSP and watch the STATUS window on the 2232. It should first say "Loading Modem 44" and display "DSPdat." If you are uncertain about the modem, type at the command prompt Modem <enter> and it should reply 44. If not, type Modem 44 <enter>. You should now be set up with the 2232.

Select SSB. Upper or lower work just as well, though the tuning frequency will shift a bit. Tune through the signal. Note the DCD light should come on. Tune for maximum signal by ear. There should be a single bar lit in the Port 1 tuning window. Tune the radio, SLOWLY, to center the bar. The bar position updates very slowly, as if the software only does so when it has time. So tune 200 Hz or less, wait for a response, and then adjust again.

You should be seeing lots of stuff in your terminal program. Some text, and lots of control characters. What you see depends on what you have your terminal program set for. That isn't important here.

One thing to consider is there have been a number of reports that P3T does not work at certain serial ports speeds. Unfortunately, the reports do not all agree. I can get everything but 19k2 to work. Everybody gets 1200 baud to work. So, it might be safer to set the 2232 to Tbaud 1200 and then restart before exiting.

Now start P3T, set it for your Tbaud rate. Note that after you spin the box you need to click on the speed and highlight it. Also select a 512 rather than 514 blocks. Exit P3T to save the settings and then restart. Check to make certain your changes took. Click raw, and you should be getting at least something. Note that at times the control stations switch to a completely different TLM string while they are doing something. The way to verify this is that you do NOT see plane text at your terminal program.

Hope this helps.

Peter,

One of the original developers, no longer affiliated with
AEA/Timewave, is working on an uploadable modem which will support the
new 514 byte TLM format with the CRC bytes. That will be done when it
is done, and then released after testing. Other than that, I am not
aware of anything. Timewave toyed with the idea of a major upgrade,
but that vanished when they went to Chapter 11. Sorry.

Try 'WXtrack' from David J Taylor, Edinburgh
Web site: http://www.david-taylor.pwp.blueyonder.co.uk/

It's special for weather satellites, but it shows you also the
information from others.

Regards,
Rainer

3013. Andrew Hard line 4-sale LDF5-50A

I have Andrew 50 ohm hardline, model LDF5-50A for sale. I would like to get $2.50 per foot with shipping to be arranged by the buyer. I have a quantity of 1350 feet in a new, untouched factory roll available in addition to a partial roll with about 350 feet used off it (800-900 feet left).

Loss is about 3 dB @ 6gHz. This is the perfect feed line for the new microwave bands of AO-40!!

I can, possibly, arrange to deliver in the New England area using my pickup truck. Expenses to be negotiated before hand.

My info is in the signature block below.

If a satellite had an elliptical orbit, that brought it through the magnetic field of the earth, could you get enough current to power a small satellite? I was wondering if maybe you could launch a little box, with a transmitter on it, that could spit out like a big loop of wire. Use the current to charge a capacitor or something, to power a transmitter.

It was done on an earlier shuttle flight, the voltages were enormous! I
don't remember the particulars, but it was several miles of wire strung out
behind the shuttle.

Can someone who's in the know fill in a few answers for me about the different digital formats?

How do the FSK and PSK modes relate to what is also known as G3RUH and K9NG formats? What satellites could I work with a PK-96, which does 9600 baud K9NG and G3RUH formats, as well as 1200 baud Bel-202 compatibility, with a TAPR modem disconnect header?

Thanks.

If that would work, you would have to consider that you are tapping
on the kinetic energy of the satellite. I.e. you are breaking it and
it will fall back to earth sooner than it would without it.

G3RUH/K9NG = 9600 bps FSK
Bell-202 = 1200 bps AFSK

The first is used by a couple of packet satellites, mainly those from UoS.
(Uosat, kitsat etc)

The second was put on board the Arsene satellite, but it never worked.
It was also used on MIR, and probably will be used on ISS (if only to
indicate that there is no progress in amateur radio).

PSK modes:
1200 bps PSK is used on JAS and some American packet satellites (pacsat etc)
400 bps PSK is used for telemetry on Phase 3 satellites.

These modes cannot be received with a PK-96.

>other Timewave products, past, present or future!

Maybe it would be a good idea to look again at a versatile DSP box for
amateur radio, but then not driven by obsolete Z-80 technology.
The box does not need processing power aside of the DSP, as the PC in every
shack is more than capable of performing the tasks that the Z-80 performed
in the days when it was assumed the box was used with a dumb terminal.

A modern box could be USB-connected and would only do the modem and/or
filtering functions. The DSP code would be downloaded by an application
running on the PC. This application would also perform all of the higher-
level functionality, which is now split between the Z-80 and the pakratt
program running on the PC.

The box would have both audio inputs and outputs (and a headset/amplified
speaker connection). At most there would be some simple control features
(a couple of buttons and maybe a knob with a shaft encoder), which can
be read by the PC application and used to adjust some parameters while
operating the transceiver.

Such a device could be built from a really small number of components
similar to those found in very common PC devices. So even at a low
volume, the component price should be no real problem.

Of course, one can also just use the soundcard. It requires some more
CPU power from the PC, but it has an unbeatable price.

Randall,

As someone involved in Marketing capital equipment for 20 years now I find your position quite reasonable. At some point a company has to move on, and when it is patently unprofitable to manufacture the product, that's a good time. It is actually interesting that you did the exeriment of doing a final run and trying various price-points, most companies would not have gobne to such lengths.

You separated firmware from DSP software development in your attached note. The implication is that a knowledgable person could write the DSP code without futzing about in your firmware and get it loaded into the machine. That's great! How does one find sufficient information on the DSP side of the 2232 box to allow this to happen? Is there a document available that would give an experienced DSP programmer enough knowledge of how to write for the 2232 and get the code into the box (without screwing up everything else!!) that may be made available? Of course, Timewave would need to make it VERY OBVIOUS that they are not responsible for 3rd party errors/mistakes. Twer I them, I'm not sure I'd even want to offer to distrubute freeware/shareware just in case some code did have problems....but I guess having enough disclaimers would make it OK.

Anyhow, thanks for the response, and you were right, you did raise a question or two...

Best Regards,
Peter

Rob,
Thank you for your your comments. Rest assured that a device such as you describe is among the several options we have investigated for the ham market (and for related markets). We even started into a design (the DSP-2232zx) that incorporated a newer architecture, but decided not to pursue that particular design for marketing and financial reasons. Obviously, we are continually monitoring the ham market and the available DSP software and hardware technology, but we will not disclose our precise technical or marketing strategy (Not that it wouldn't be fun to discuss it on a newsgroup!). Our future products and marketing efforts will have to speak for

themselves.

I just realized that I didn't sign my last post to this news group, so I will correct that now.

Chris,

Try this:

cmd:AWLEN
AWlen 8
cmd:DSP
Opmode was PAcket
Opmode now DSPdata
cmd:MODEM
MODem 44
cmd:

You must be in the DSPData mode, which should automatically select the
correct modem 44.

After reading this thread.....I am wondering about the DSP-2232 unit. I had one when they first appeared but sold it later to work on other projects. Now with the AO-40 coming online I have info on a used unit.

Being away from the satellite/packet aspects, and wondering about these posts regarding this unit, "Is this still a good box to use".
I do not want to turn this thread into a "is better than that box thread", just to get some info on the DSP-2232 and its current standing in the ham community.

Maybe there are newer boxes that will work better for sat/packet.

The DSP-2232 has a command "QLoad" that sets the DSP-2232 to load DSP modem software through the serial port. There is a half page outline of the process in the DSP-2232 manual, but it does not discuss the details of a user modem design, only how and where to load the user modem program into RAM so that it may be used like the other modems in the DSP-2232. Unfortunately, we have been unable to locate a document that goes beyond this command description in the manual. If there is such a document, it is buried deeply in the AEA engineering archives - we have looked because this is not the first request for more information on this subject! Given the schematic, the description in manual, some experimenting and perseverence, a competent DSP programmer should be able to write modems for the DSP-2232. Our programmers have told me they could do it, but we simply have no resources to allocate to it, as I mentioned earlier. It is possible that there may be copies of a programming document that we don't have, or that some who has written a modem for the DSP-2232 will be willing to share his or her knowledge with the ham community. If so, we will be willing to post it on our website.

3028. AMSAT NEWS SERVICE BULLETIN 327.01 (AO-40)

Newsgroup: rec.radio.amateur.space
Date: 2000-11-22 00:00:00 UTC
From: N1RZ <n1rz@timhavens.com>
Message-ID: <t5WS5.90751$1Z3.237088@e420r-sjo3.usenetserver.com>
Source record: 7721

SB SAT @ AMSAT $ANS-327.01
AMSAT SPECIAL BULLETIN

AMSAT NEWS SERVICE BULLETIN 327.01 FROM AMSAT HQ
SILVER SPRING, MD, NOVEMBER 22, 2000
TO ALL RADIO AMATEURS
BID: $ANS-327.01

AO-40 command stations have been quite busy lately as general housekeeping tasks have been underway to verify the health of the many complex systems onboard AMSAT OSCAR-40 - all with very good results.

P3D Project leader Dr. Karl Meinzer, DJ4ZC, informed ANS that following the successful launch and injection into nominal orbit, initial telemetry from the satellite was expected on 70-cm at about the 3-hour mission mark. This did not happen and consequently the spacecraft was switched to use the 144 MHz middle beacon as the main telemetry downlink. This required a new program to be uploaded into P3D's IHU-2 system.

After new software, communication was established and the health of AO-40 was analyzed and tested. DJ4ZC happily reported "except for the UHF transmitter, everything was found to be nominal and working fine." The attitude control system was then calibrated and torque reorientation operations started, which are still underway. Both 2400 MHz transmitters were successfully operated and pictures from the separation sequence are now being downloaded and will soon be available.

The first planned orbit change will soon take place and that should result in a 50,000 km apogee. This will allow a thorough study of the 70-cm transmitter problem using P3D's hi-gain antennas (which) would then be available.

After the first orbit change is completed a test the electric propulsion Arcjet system will take place (and) if successful, it will be used to further
increase the apogee of AO-40.

AMSAT-NA President Robin Haighton, VE3FRH, told ANS that "plans are in place to make AO-40 available for a limited period of general Amateur Radio use possibly within a week or two." This provisional operation would involve "one or two bands at a time," said VE3FRH. Details of the limited test period will be announced by an official AMSAT bulletin and via the AO-40 telemetry beacon.

Stay tuned to ANS for additional bulletins from AMSAT, the
official source for information on AMSAT OSCAR-40.

[ANS thanks AMSAT-NA and AMSAT-DL for this information]

Chris,

Just type the mode you want. Packet, morse, baud, etc. You will
probably get a "wrong modem error." Just enter modem 12 for packet,
etc.

The manual is a bit cryptic in places. Other places it is worse.

Okay, Rob, I appreciate the response. From what I can gather of your information, there doesn't appear to be much the PK-96 will do for me as it relates to the digital modes for the newer satellites. Would it serve the function of acting as an APRS terestrial-to-satellite relay tnc for those satellites it will work with?

If refined, conductive tethers can go both ways, so to speak. A
satellite-tether system can slice through Earth's magnetic field and
generate electricity at the expense of altitude, or it can pass a
locally-generated current to induce a magnetic field to interact with
Earth's magnetic field and gain altitude.

They seem to be finicky. I recall one Shuttle experiment that was on its way
to success when the tether snagged on the reel and broke. D'oh!

ISS ham radio operations commence.
2000-11-21

International Space Station commander William "Shep" Shepherd, KD5GSL, reports that he was able to take a few minutes out of a busy schedule to start general QSOs with the ham community. Shep says that he was able to speak with a few lucky hams last Friday, 2000-11-17.

With the recent arrival at ISS of a Progress automated cargo craft, the crew's work pace will redouble. With the planned launch of the STS-97 to the ISS on November 30th, the Expedition One crew will be working long hours to prepare for the arrival of space shuttle Endeavor carrying a large new solar panel for the ISS.

More information about Amateur Radio on the ISS is available at the http://ariss.gsfc.nasa.gov/ web pages.

Thank you Alan.

Now all I have to do is wait 8 hours to try it out.

:-)

BTW, if you guys are not on the list serve, this is from Karl.....

AMSAT OSCAR 40 **STATUS REPORT FROM DJ4ZC** (2000-11-20)

1. AMSAT OSCAR 40 had a perfect launch on Nov. 16 and was
injected into a nominal orbit.

2. Transmission of telemetry from OSCAR 40 on 70cm was expected
3h after launch. But we ran into a problem with the 70cm
Tx. Consequently the spacecraft was switched to use the 2m
middle beacon as downlink for telemetry. This required a
"repeater program" in IHU-2 which was uploaded.

3. After communication was established, the health of
OSCAR 40 was analysed and everything testable at this stage
except for the 70cm Tx was found to be nominal and fine.

4. The attitude control system then was calibrated and torque
operations were started to take the attitude to 270/0. This
reorientation should be finished in a few days. Then we are
ready for the first planned orbit change (400N-mtr) resulting
in 50000 km apogee altitude. The attitude will also allow a...
thorough study of the 70cm Tx problem with the hi-gain ant.

5. The two 2400 MHz transmitters were operated and are ok.

6. Pictures from the separation sequence are being downloaded
and will shortly be available on our website. There we will
also show the test-schedule for some first amateur operations.

7. Steps after 1st orbit change: test the electric propulsion
system and then use it to further increase appogee altitude
using the arcjet before the big i-change.

Well, there's your spark gap transmitter.

Yeah, I remember that tether experiment. Was that from the
magnetic field of the earth? I guess the wire is passing
through the field and that causes a current.

I wonder now, if there's any way to calculate how much power
you'd get from a coil of wire, or a wire, in orbit?

You must live in the US :-)

Energy is not free. There is no such thing as a perpetuum mobilee.

In this case you would be tapping energy from the kinetic energy of the
spacecraft itself. So it would slow down, and finally dive into the
earths atmosphere.

Yes, it's called the Dynamo Principle and was discovered by Michael Faraday. The current it produces can be calculated (NOT by me!) if you know the strength of the magnetic field, and the velocity of the conductor through it. My College Physics is too rusty tonight, but any College-level Physics textbook will explain it in great detail.

I guess it depends on how long it takes. If this is a big problem,
then maybe then you could use this reversed. And, that is put energy
from solar energy panels back into the wire, to raise the orbit of a
satellite back up a little bit!

3040. Re: DSP-2232 New Modems???

Newsgroup: rec.radio.amateur.space
Date: 2000-11-22 06:57:21 UTC
From: rgawtry@timewave.com
Message-ID: <8vfqmb$v5t$1@newsfeed.minn.net>
Source record: 7710

Since the sucessful launch of P3D/AO-40, we have had numerous inquiries about the DSP-2232, ranging from how can someone get a new one to requests for info about 400 bps PSK demodulation. I'll try to clear up a few things about the DSP-2232 from the Timewave viewpoint. I am sure this will raise a few more questions (and opinions!). I will try to reply to those additional inquiries which can be answered.

1. The DSP-2232 is no longer in production. Timewave does not plan to produce additional units because the marketplace has proven it will not support the approximate $1000.00 price we would have to charge to make a reasonable profit on a run of 100 units. This price is driven by the parts availability and cost, as well as the assembly cost. In 1997, we offered about 60 units for sale at about $700 each. We only sold about 2 units. Then we lowered the price to $500 each. They sold out within a couple of months. Believe me, selling these units at $500.00 is NOT profitable! IF we had a solid order for at least fifty units, we would consider producing a special run just to fill that order. We would not produce extra units on a special run on a speculative basis. The possibility of a special order is predicated on the availability of obsolete and hard-to-find parts!

2. Approximately 1500 DSP-2232s have been produced. We estimate as many as 500 units are in commercial and government service and are not candidates for upgrades. Other units have been destroyed by lightning, put on the shelf or lost. It is not clear how many fall in this category, but 100 is a reasonable number. Allowing for inaccuracies in these estimates, perhaps 1000 units exist in the amateur service today.

3. The firmware source code will not be placed into the public domain. The code is shared among several products (PK-232, PK-900, PK-96, IDR-96) and we cannot give away our intellectual property for competitive, legal and financial reasons.

4. We have no software/firmware upgrades planned for the DSP-2232. It does not appear to be economically feasible nor a good use of our resources. (That's not a statement we like to make, nor do we take it lightly, but it is true).

5. Timewave will support any 3rd party (including former DSP-2232 developers) who can and will provide downloadable DSP modem programs for the DSP-2232. If the 3rd party offers the downloadable DSP code to the amateur community at no cost or on a shareware basis, we will post it on our website for downloading without charge.

6. Timewave does service and offers tech support on the DSP-2232.

7. This discussion is about the DSP-2232 only and does not reflect on any other Timewave products, past, present or future!

"Newer satellites" are those after about 1991, not those that aren't
yet launched or operational.

I don't know what you would want to do with or what would be the
requirements of "an APRS terestrial-to-satellite relay". Most of the
digital satellites provide file store-and-forward.

I am not a member of a religion that believes that free software is
the only way to achieve one's goals. Free software has advantages and
disadvantages. In some areas (e.g. office suites, web browsers) it
has become very clear that it does not stand a chance against commercial
software. So, for those areas commercial or otherwise non-free software
should be available without it somehow being considered inferior.

>> But I am using SuSE Linux, so that doesn't matter.

>IMHO, Debian will always be the best distribution in a technical
>since because we are not driven by marketing, profit, etc.
>We don't have to be competitive.

That is mainly what I have against it. It only exists for the purpose
of satisfying the makers themselves, and does not consider market demands.
SuSE Linux is much better in this respect. Sure there may be some
technical aspects in which it is not as good, but in the end that is
not what matters.

For example, see how much effort they spend on easy installation and
suppport for the first-time user. This is something that has been
seriously lacking in Debian for a long time. This is only natural, because
it isn't a very important point to their main audiance. But at the same
time, it works as a setback for Linux acceptance in general.

Sure it would be best if everyone would co-operate, so that the effort
spent on packaging would not be duplicated so many times, and time would
be available to optimize every aspect of Linux packaging and installation.
However, that seems to be an ideal that is very far away.

Primarily because of religious standpoints.

I am wondering if anyone has dealings with the JVcomm32 folks? I
have taken a look at the web site and seen the technical specs for
supporting the modes. What is the fastest rate anyone has set the
DSP1232/2232 to and had it run? Will it do 38400 or faster?

If it will do 56800 we can easily modify the sstv programs, fax,
wefax, etc. to talk to JVcomm32.

Would that be interesting? I can't find my box! I will tear my storage
apart and find it. I have a DSP-232, DSP2232, DSP-12, and
an EVM 56002 and I can only find the EVM and the TAPR enclosure.
I will keep looking 'until satisfied.

FYI, Alan and Charles have received the AO-40 demods and
should be able to tell me if they work shortly. If not, then it will
have to wait 'until I dig my boxes out of storage.

Bob

Some of the birds that have FM capabilities and tncs on board are occasionally switched to where they will receive APRS positions from the Kenwood D7A (or newer G model?) and D700 mobile radios and downlink back into the terrestrial network to an appropriately configured ground station. This is to allow persons in remote areas with no access to the ground network the ability to have it heard by a satellite and then fed back into the APRSserve system to be seen on the internet. I think one they have done this with is SunSat. It appears a fellow named Doug Quagliana, KA2UPW, has written a sound card program that allows a radio to uplink a 1200 baud Manchester-style signal using a computer without the need to have a TNC or PSK modem, which from what I've found on that site means it would work with some of the pacsats.

I guess I just answered my own question about the PK-96, then. From what I can see, since it doesn't do PSK/Manchester style encoding, it couldn't uplink to AO-16, LO-19, or IO-26. However, from the sat chart I'm looking at, it appears UO-22, KO-23, KO-25, and TO-31 all do 9600 FSK.

The information I read indicated they didn't hear the 70cm telemetry beacon after launch, so they commanded the 2 meter middle beacon to come on. The 2400 mhz transmitters have been successfully tested. The first planned orbit change will soon take place and that should result in a 50,000 km apogee, which will allow a thorough study of the 70 cm transmitter problem using the high gain antennas.

For the complete bulletin posted yesterday about AO-40, go to:

http://www.amsat.org/amsat/news/ans.html

Maybe it should be added that the kinetic energy of a satellite like AO-40 is *HUGE*, and that you could withdraw electrical power for a small consumer for a long time before it would re-enter. At first it would seem like you get te power for free.

It is that high ratio (between kinetic energy and power obtainable this way) that fools people into thinking that this is a feasible way to draw power and solve the world's energy problem. This is quite common with "perpetuum mobile" inventions.

Here is the link for the French DOS program

http://www.ccr.jussieu.fr/physio/amsat-france/eindex1.htm

and here is the relevant DOS commands translated to
English. (thanks to Eddy, G6UQI)

The following works to translate P3D's telemetry files.

1. Record telemetry sound using windows sound recorder (call it p3d.wav) and
place it in the directory you have pskdem.exe in.

2. Use Spectogram program (available from
http://www.monumental.com/rshorne/gram.html) to find the center freq of
recording.

3. Run pskdem, and enter center freq that you found in last step.

4. Run tlmdec, and redirect it into a text file (i.e. tlmdec >telemetry.txt)

5. Read telemetry.txt file showing telemetry that you recorded.

If you run the software with the p3d.wav file provided you should get the
following:

########### P3D IHU-1 Affichage TLM - OE1KIB, OE1VKW -F1HDD -###########

Bob,
The specification for the DSP-2232 is 38400 if you set it with the TBaud
command (it won't autobaud to 38400.) I haven't seen any references to 56800
anywhere in any of the AEA engineering notes, but that doesn't mean it may not
be possible - someone will have to try it. At the moment, our only working
unit is on loan, so we can't try it!

Yes, but it's not "free" power. The energy comes from the satellite's
kinetic energy, so as you produce (and use) electricity, the orbit slowly
decays as a result.
Steve Quigg.

I have a fix for LogSat V5.2 which allows this Win_95/98
patched Y2K tracking program to work under Windows_3.11
and OS/2 Warp V3. You need to copy the patched Win_95/98
version onto your Windows_3.11 installation as after
patching for Y2K this 16 bit program is still 16 bit.
The patch program is the only 32 bit component.
I use LogSat on my old 486DX2-66 with 20meg RAM which
free's up my other PC for the net.
The LOG BOOK part of this program is very useful.
Also quite good that the 16 bit program runs on so many
OS's and looks the same which ever you are using.
It's a shame that LogSat are only supporting Win_95/98.

RS 13 is KT, RS-12 might be mode A or K, I have tried using it yet. BTW this is the first time I've ever heard both transponder turned on at the same time on any RS satellite. It's normally always one or the other.

I tried both on my last pass. It was 70 degrees elevation so I should have
been able to do something. I tried KA, A and KT and heard nothing. They
must both be in mode K. I can't hear myself in that mode so I don't know.
Oh well, AO-40 will be available soon....can't wait!

Yes that is exactly where opinions differ... I think it is best for
the users (in the end) to have a large market share. Look at Windows:
technically it is not very good, but because it has a large market
share there has been a lot of software developed for it (both applications
and internal structure like APIs and object comms), and the user benefits
from that, because he can use the computer for what he wants to use it
for.

Attempts to do the same for Linux have resulted in the same fight over
what is free and what isn't, and double development. Result: while
the developers are striving for technical superiority the actual product
is still inferior to Windows in usability.

That is a pity... sometimes it is necessary to take standardization,
documentation and cooperation as a first priority, and technical pet-peeves
as the second. But many Linux developers, never having worked on a
large software project, fail to realize that.

Debian is driven by technical ideals. We strive to have the best
distribution judged only on technical merits, not on market share.
SuSE, Red Hat etc will always do whatever is needed to make
the most money etc, not what is necessarily best for their users.

> Sure it would be best if everyone would co-operate, so that the effort

There are attempts to simplify things, like the Linux Standard Base
project. However, Debian is not about to lower its standards without
good reason.

3076. Help, I blew my preamp... :(

Newsgroup: rec.radio.amateur.space
Date: 2000-11-26 00:00:00 UTC
From: Gerry <ka1stz@yahoo.com>
Message-ID: <t22h1mk3e2nq61@corp.supernews.com>
Source record: 7614
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment,rec.radio.amateur.space

Is anyone familiar with the preamp circuit in Mirage amplifiers? I have
a model B3016 (2M, 30 in, 160 out), and I blew the preamp last night. I
assembled a new station, putting my amps on the tower. I tested both amps &
preamps, all was working fine (great gain on those preamps too!). I went to
test the circular polarization switch to my KLM 2meter antenna, and the
relay didn't fire. I didn't think the relay coil shared a ground with the
coax ground but apparently it does. I hooked up the 12v backwards to the
antenna relay, which I guess sent the 12v through coax ground to the preamp.
After doing that, the preamp no longer works. Signal feed-through seems
fine with the preamp off, but when I turn it on the signal is weakened
(attenuated) a lot. I changed the FET in the preamp circuit, but that
didn't do it. The power amp circuitry seems ok too.
It seems as though there are less than 10 components in this preamp
circuit; does anyone have an idea of what the most likely damaged component
would be? Or a suggestion for troubleshooting with basic equipment?
Thanks! -Gerry KA1STZ

Message-ID: <3A2167A2.5F45383B@jps.net>
Source record: 7617

On the Amsat FTP site is a general telemetry decoder program
for Windows (WinTel.exe). There are a number of templates for
different satellite telemetry formats. AO-40 isn't one of them
(yet).

Has anyone created a .CFG file for AO-40? Alternatively, are
there any telemetry decoders that run from a raw text log?
I am using Nino's excellent AO-40 sound card-based "modem",
and can see the ascii text clearly, but the rest of the
data needs a decoder of some sort to read. The program logs
all it sees to a txt file.

Thanks,

Greg.

There are a pair of MPS-2222 transistors used in the preamp stage. When mine blew, I wasn't sure which one, or if both, went bad, so I replaced them both. This fixed the problem in my case. You might want to check the relay and the two diodes protecting it while your in there, you could have blown these also (however, if you power up the amp and can hear the relay kick in and out when you work the preamp switch, then you're probably OK here).

Another thing to check is the contacts on the relays, when they get dirty, the preamp becomes intermittent, sometimes it amplifies, and sometimes it appears to attenuate.

A word of warning, be very observant when making the replacements, the holes in the pcb are not aligned the same as the leads on the transistors, so you need to bend the leads around a bit to get them in the right holes...

73 and good luck,

Dan - W6DKN

Dan, thanks for your input. I believe the MPS-2222s are fine; the relays operate normally. I think the contacts are clean also, as I played with the preamp (switching it on/off) for about 30 minutes before I blew it. It seemed very consistant when switched on. You do have me wondering on the FET leads though, I think they were aligned with the holes on this one (I hope!) I'm still looking! -Gerry KA1STZ

Hi.

Download my program MapWalker
http://members.nbci.com/kourdakov/mapwalker.htm

It goes with source code and you'll learn how to project lat and lon to map
and also you will have an opportunity to create your own maps.

Enjoy.

A 2.4 GHz feed horn would be rather large for a 3 ft dish and would block the aperture, thus reducing the efficiency (gain). Best to use a dipole or helical feed. Check out Downeast Microwave's tri-band feed (3B FEED $15 and 3B FEEDK $35, estimated prices, old).

They're going to "nudge" it gradually into its final orbit, so we're going to have to update the keps pretty regularly for the next 9 months.

Your time and position seem about right, based on the keps I have (from amsat.org)

Hello! I am building an "AMATEUR.SCF" file for Stsplus. The SCF file limits me to 30 satelites and 2 geosync sats.

The doc file says this...
"The first two satellite slots, #1 and #2, are reserved for geosynchronous communications satellites."

Out of the list of 33 amateur sats below, what three could I discard? I was thinking that MIR can be tracked separately. Please give me your opinions on the three sats I can ax.

Here is the list... (reading from left to right)

AO-10 UO-11 MIR RS-10/11 UO-14 UO-15

AO-16 DO-17 WO-18 LO-19 FO-20 AO-21

RS-12/13 UO-22 KO-23 AO-27 IO-26

KO-25 POSAT RS-15 FO-29 MO-30 TO-31

GO-32 SO-33 PO-34 ISS (ZARYA) SO-35 UO-36

WO-39 OO-38 AO-37 AO-40

Nope -- the 2 MPS-2222 (or MPS-A13 on the schematic) are general
purpose xistors, and are used in the B3016 to drive the 'change-over'
relay and to drive the 'switch in the preamp' relay.

The preamp is a J309 -- and just a handfull of components (as the
original poster noted.)

I have the B3016. I was somewhat unhappy with the preamp's
performance. I scraped off all the preamp's components and
installed a Hamtronics LNY-146 on some short stand-offs over
the same piece of real estate where the original amp was.

http://www.hamtronics.com/hamtronics.html

For $29 you get 0.6 dB nf and 18 dB gain.

If you check current ANS bulletins you will find that
several of these satellites are either defunct, or are
not in amateur service. RS-10, DO-17 and WO-18 have
been off the air for ages. POSAT was in amateur service
for a few weeks when it was launched, but has been entirely
commercial since. And so on.

3099. SatTrack Compilation Errors

Newsgroup: rec.radio.amateur.space
Date: 2000-11-27 05:13:08 UTC
From: Jim Jerzycke <kq6ea@amsat.org>
Message-ID: <3A21ED64.5344FB68@amsat.org>
Source record: 7621

Hi, again. Well, I was able to find 3.1.6, and I edited the Makefile as suggested by Rob, PE1CHL. Now, however, I get the following errors, and gcc exits.
I get "In function 'main' return type of 'main' is not 'int'". This happens in each of the sections it tries to compile.
Then towards the end I get in "CheckKeyboard" that 'TCGETS' and 'TCSETS' are undeclared.
I looked in the sections, and I see where 'main' is, but I'm totally lost here, and don't know what to change/edit.
TIA, Jim KQ6EA

Don't worry about it, I got the same warning messages when
I compiled SatTrack. It is a bit tricky to configure the makefile
for SatTrack. I'll send you a copy of my makefile, it shouldn't
need much modification to compile on your system.

Make sure you don't have the version with the Y2K bug!

3101. Az-El rotators??

Newsgroup: rec.radio.amateur.space
Date: 2000-11-28 00:00:00 UTC
From: jimmy john <jj@sandwitch.org>
Message-ID: <4A8A59F2BDCDD311BFC800508BA36AC805B479AD@www.indianarep.com>
Source record: 7550

I've only found one in my stack of catalogs and it was over $600. I'm looking for a light-duty and relatively inexpensive one for mounting my Arrow yagi, probably from a tripod. Portability is desirable. I suppose I could lash up a couple of stepper motors and fabricate something, but the mechanical part of construction would be a real pain - no welding/brazing gear at this end.

Anyone have a good recommendations?

thanks in advance

3102. Do not subscribe to Ameritech DSL

A word of warning,

Do not subscribe to Ameritech DSL. If you already have, your service will not get better, for even I held out hope.

The amount of actual service provided to our site was 3 weeks of uptime over a period of 3 months. 75% Down time, and they will not refund our moneys.

Their service agents at the call centers where absolutely no help, and knew very little about IP. The service tech's that would come out on site really where not to bad.

There was the Twit who downed our SPAD in the CO for 4 days for maintenance without telling anyone however.

After a couple weeks of finally being up, they changed out static IP, oblivious to the meaning of the word STATIC.

Sorry for the rant, I hope it helps someone out there.

It is possiable to use some of the older Alliance rotators for the elevation rotation. I thik the number is U-100. YOu have to cut off a portion of the rotator so a mast will pass through the rotator and mount it sideways. It is not too difficult to mount them on a sheet of aluminum or steel.
Some of the older ARRL handbooks have the info in them and tell how to make a mast for them. Usually a short piece (2 feet or so) of aluminum or steel tubing an some longer pieces of pvc pipe with wood in them for strength.

The ISS has a 20 MHZ bandwidth data link built by L3Com/Microdyne to deliver private communications and data, as well as software updates. The receiver is a customized 700 series receiver we built about a year before the last shuttle mission It's part of a analog KU band system to be used, till more of the space station is built. It can also be used to uplink radio or TV signals when it's not needed for other communications.

It's not only possible, but I've done it. I'm not sure what the exact Alliance model is (type 83?), but they're all similar in construction. I found a regular ham-type Az rotor and controller at one ham swap, and the TV rotor at another. I drilled a second set of holes on the Az rotor, and mounted the TV rotor sideways directly on it. A plastic bag temporarily keeps water out of the TV rotor - they're not designed to be waterproof except when mounted vertically.

Both rotor mechanisms use an internal momentary contact switch to indicate travel (every 6 degrees on one, 10 degrees on the other). Some quick work with relays and a Basic Stamp, and I have an automatic Az/El controller driven by FODTRACK. (Well, it wasn't that quick, but definitely a whole lot cheaper than the commercial variety.)

I also found an identically-looking Alliance rotor that uses a variable resistor instead of the switch, so if you are building a controller (or scrounging one separately), be sure you match the positioning method.

Good luck,

Greg.

Come on now, people. You should know by now that if you want reliable information about amateur satellites, you need to go to: www.amsat.org

Especially with all the interest in AO-40, as soon as there is information to distribute, they will create a bulletin and post it on their site. If it has to do with amateur satellites, they're obviously the ones who will have the "in" on what's going on.

>Hi, Rob. I checked, and I do have the linclude package installed. Can
>you suggest a book to read on learning how to debug this kind of stuff?
>NONE of my Linux books or 'C' programming books go into this level.

This is not really C programming, it is a peculiarity of the Linux
system. Maybe you have installed another kernel source and then removed
it.

The point is: of the include files in /usr/include and below, some define
values and data structures (like the TCGETS) that are exported by the
kernel. So the matching include files really belong to the kernel.

This is solved by putting a couple of symbolic links in /usr/include that
point to a kernel-version dependent directory where everything is stored:

in /usr/include:
lrwxrwxrwx 1 root root 29 Jan 13 2000 asm -> ../src/linux/include/asm-i386
lrwxrwxrwx 1 root root 26 Jan 13 2000 linux -> ../src/linux/include/linux

in /usr/src:
total 18
lrwxrwxrwx 1 root root 12 Jan 13 2000 linux -> linux-2.2.14

Now when you don't have the directory these links point to (in this case
./src/linux/include = /usr/src/linux/include which again points to
linux-2.2.14 on this system) the files will not be found.

Because not everyone needs all sources of the kernel, SuSE has split the
kernel source package in two separate packages: one containing only the
includes, and the other containing the remainder. That second package is
only required when you want to compile your own kernel.

When you have messed with this, check the above structure.
When not, I would not know what is going wrong here.

Rob

For any given instant. One might get a minute of useable music per station
per pass. Maybe. I can imagine the ISS gang as early listeners to satellite
delivered radio - and even then only for part of each orbit :)

3112. InstaTrack v1.5 ???

Hi All:

I've also tried Nino's psk 31 decoder (nice!) and have successfully gathered tm data from ao-40.

I too have little idea how the indicators work except that:::

Data is gathered best when the clock alignment is in straight lines and all or most of the waterfall is between the two lines . It appears that the lines can be moved up by dragging the left mouse button.

NOW, does anyone know where I can get software to decode the ascci data which accumulates in the tm file? The AMSAT software seems to want a tnc not raw data files????

Where did you hear *that*?

There is no information on the problem with the 70cm transmitter.
None. Zip. Nada.

Why worry? All frequencies below 1 GHz are boring anyway. :-)

In all the flurry to listen in on AO-40, I suddenly wondered if "they" bother to listen to "us".

I wonder what 50KW broadcast stations might sound like from ISS and whether any homesick astronauts (more likely Mir that ISS, I suppose) has tried to listen to terrestrial FM/AM commercial stations while away from home.

Hmmm, a new Nielsen catagory: "space stations 18-40"...

Source record: 7637

I have all of about 30 minutes experience with PSK31.

I've downloaded the IZ8BLY decoder and some audio files (hey, AO-40 isn't visible from here right now).

Uhmmm, what's the goal here? I now see what a "waterfall" looks like, and I see a horizontal trace that appears to deflect in step with the audio.

This particular decoder shows two vertical lines over the waterfall that I have no (apparent) direct control over. It appears to float over some center frequency that shifts up or down, and has a fixed spacing between them.

I guess that I am supposed to "mouse over" the waterfall and slide those horizontal bars up or down (I can't "lock in" to any particular position - i.e., after the mouse moves out of the waterfall).

Am I right in assuming one bar is "1" and the other bar is "0"? And that my goal is to adjust the bars to get a nice bit transition between?

Is this the way they all work? (All the soundcard-type decoders, that is?)

So far, no decoded data has appeared, so I'm obviously not doing something right. I just can't figure out "what" because I don't know what the "goal" is.

thanks in advance,

don

Since everything is line of sight to them, they would have no trouble picking up any station they want... trouble is, so many stations share their frequencies- just have a look sometimes at Funkenhauser's radio station lists (http://www.inforamp.net/~funk/) and see just how many stations are on a single frequency. It's not a problem for us earthbound mortals, with our all-limiting horizon, but hey- those ISS guys have an antenna 380 KM high. Their whole radio dial would be a cacophony of noise.

Last weekend I caught them on a late night pass on 143.625... the transmitter was on, but no conversation was taking place. In the background I could hear music playing. Couldn't make out the song, it sounded like something country.

Yes, the build process is a bit ugly. Rob will disagree with me on this
point, but the license is ugly too. I recommend you try out predict
or mtrack, as they are both capable satellite trackers which are
free software.

Having said that, I still use sattrack myself out of habit.

Well, it looks like Thomas has beaten me to it, he has released a
demodulator. I'll test it and see if it is still worthwile to continue.

>In /usr/include, I have a symlink to /asm (a lot of '.h' files) and a
>symlink to /linux (another group of '.h' files, and some other

>In /usr/src, I have a symlink to /linux, which leads to /include, which
>has both /asm and /asm-i386. It also has a '.config' file in it. So it's
>/usr/src/linux/include with both the asm files.

>/usr/src also contains /linux-2.2.14 (no symlink, it's just there), and
>when I open /linux-2.2.14 I have:
>/usr/src/linux-2.2.14/include and again I have /asm-i386 AND another
>symlink to /asm, which takes me to all the header files.
> Sorry to be such a bother. I'll carefully read your reply again, and
>read some more on symbolic linking.

It looks like you have everything in place as it should be. From the above
I cannot really tell if /usr/src/linux is a symlink or a directory in
itself. If so, it probably contains an older version of the kernel. Or
maybe a newer version. It depends on what you did manually and what you
installed via YaST or rpm.

Try this:
head /usr/src/linux/Makefile

That should display the first lines of the Makefile and should show
the kernel version on the first 3 lines.

Then you can cd to /usr/src and mv linux linux-x.y.zz (the version you
found above).
Finally, make a symlink to the newest version (2.2.14 or the one you
just moved) using: ln -s linux-2.2.xx linux

Then you should have a reasonably standard situation.

In the directory /usr/src/linux/include the name "asm" should be a symlink
to "asm-i386" (assuming you have a PC).

Following the entire (complicated) chain of symlinks, you should be able
to do something like:

```
less /usr/include/asm/termios.h

It should come up with a file that starts with:

#ifndef _I386_TERMIOS_H
#define _I386_TERMIOS_H

#include <asm/termbits.h>
#include <asm/ioctls.h>

Similar for /usr/include/sys/termios.h:

#ifndef _SYS_TERMIOS_H
#define _SYS_TERMIOS_H
#include <termios.h>
#endif

When that is all OK, at least your symlinks are correct.

When it still doesn't compile, please post the exact error output.
(not those warnings about main, but the source that fails with an error)

It's possible to make an elevation rotor from some available T.V. antenna rotors. I use one called "Orbit 360", I found it at Home Depot, I think it cost about $25.00. I had to make a mounting plate and It has to be covered to keep water out. I've used it with no problem for several years. Another one
that works well is the old Alliance U100.
Look for one that allows the antenna mast to pass through the rotor.

Source record: 7559

Thank you for being so patient with me. I realize you're very busy with the port of the DSP software. I have all the files you listed, but it looks like I may (?) be missing a symbolic link.

In /usr/include, I have a symlink to /asm (a lot of '.h' files) and a symlink to /linux (another group of '.h' files, and some other folders).

In /usr/src, I have a symlink to /linux, which leads to /include, which has both /asm and /asm-i386. It also has a '.config' file in it. So it's /usr/src/linux/include with both the asm files.

/usr/src also contains /linux-2.2.14 (no symlink, it's just there), and when I open /linux-2.2.14 I have:
/usr/src/linux-2.2.14/include and again I have /asm-i386 AND another symlink to /asm, which takes me to all the header files.
Sorry to be such a bother. I'll carefully read your reply again, and read some more on symbolic linking.
Tnx, es 73 Jim KQ6EA

First, sorry for the cross-post, but this is relevant to both groups and saves me typing this twice.

I am looking for information and recommendations on antennas for space communications. I have read about quad-helix antennas in an old antenna book, and these seem to be exactly what I want. I don't have room for a dish. I would like to know of anyone's experiences using these. Also how are they to build?

I am mainly looking to recieve images from weather sats, and listening to manned spacecraft such as the shuttle and ISS. What size quad-helix should I go for and what bands are most useful? I am going to build on a motor driven alt-az mount that will be guided by computer software.

Any recommendations on these antennas would be appreciated.

David Findlay

>know what I'm doing wrong.

What always works for me:

1. don't put the mouse in the waterfall area, click on the carrier freq.

2. enter the freq you want to use. I use something like 1200.

3. tune the receiver until the waterfall pattern matches the red lines.
(easiest when the sat transmits zeroes or the sync pattern between
blocks)

Now you will see that the program locks onto the signal, when you slowly
tune the receiver the carrier frequency display will change accordingly.
When your receiver tunes in 100Hz steps, don't do more than one step
at a time and wait a few seconds for it to lock.

I have Cincinnati Bell Zoomtown and it has worked flawlessly since it was installed over a year ago. I can have four PCs running off the same connection at the same time and it works very well. Not refund your money? What state do you live in? Write the Public Utilities Commission and the FCC about charging you for services you did not receive. Copy your state representative. You'll get your money back. DSL works fine. You just have to get the right vendor.

3139. RS-12/13 RS-15 Activity?

Newsgroup: rec.radio.amateur.space
Date: 2000-11-30 00:00:00 UTC
From: Jeff Goodspeed <cmsx42@email.mot.com>
Message-ID: <3A268A1E.A7AD0F5E@email.mot.com>
Source record: 7577

My logging program "Logger" includes a satellite tracking function. I've downloaded the Kep elements from the AMSAT site and listened to the beacons from RS-12/13 and RS-15 on 10m. Both beacons showed up right on time, with the right azmith and were reasonably strong. But I haven't heard any activity from any HAM QSO's.

Do these "Easy Sats" get used? Is it worth my bother trying to transmit to them? I only operate CW. Do any Sat users work CW?

Source record: 7578

Hi,

Just happened to have to stop by home and thought I'd take advantage of being there while P3D was up to check out the new PSK telemetery decoder software I had downloaded. So I fired up the tracking program, pointed the antennas, turned on the rig and .... nothing. Last time I tried the same setup, I could hear it with 20 db of attentuation on S3, now with preamps and all, no signal. I even copied it on my FM mobile over the weekend just to see how strong it was.

I believe my equipment is functioning ok, checked a couple of distant repeaters to see if the antenna was still really up there. Can anyone else confirm for me that they are hearing the 2 meter beacon this afternoon at 3:30 EST or thereabouts? Did they switch to another freq? (I tried 145.8-146.0) or another band?

Help! :-)

Kevin, WB2EMS

You might also check with www.ssbusa.com

I spoke to the them about a month ago and they informed me that they would have available soon (after the launch of P3D, but they already had them in stock at the time...just not ready for sale) [remember this conversation was a month ago ;-)] "a professional grade 2.4~2.5Ghz Dish and Feed combo for around $400.00 Complete with radome and a Transition to type "N" (f) conn." He was telling me that these were very small, and extremely light weight dishes....I think he said something like 2-4 lbs. I can't remember the size of the dish but I don't think it was much larger than the one you're talking about....

Perhaps the feed they are using is something that you can use.

Well, that makes me feel a bit better that my rig or my mind hasn't gone,
but I'd be happier if it were there. Does it get turned off from time to
time? Change of freqs? Maybe they moved it to 2400? Do they turn it off
during orbital manuvers like firing the arc-jet?

Kevin

I've been trying to make the IZ8BLY decoder work with no luck. Frankly I don't know what I'm doing wrong.

I'm using the "default" settings on the P3D decoder, which has these values.

Center frequency = 1600
Clock Sync IIR Size = 256
Clock sync attack factor = 32
AFC attack factor = 0.025

I'm playing back the audio file recorded by N1RZ that's on timhavens.com

My "phase scope" spins madly about - should it tend towards just two directions (as in logical "0" or "1")?

The "Center frequency" bounces around 800 or so (instead of the value given in the configuration).

There are two horizontal marks that track with my mouse, but seem to do nothing. What are these?

I'd fire email off to IZ8BLY, but reportedly he is too busy right now to deal with emails.

Not knowing what things SHOULD look like hampers my attempts to figure out whats wrong.

If you have gotten it to work, please try to explain how you did it.

thanks,

don

I wasn't aware that it wasn't on continuously. Some helpful folks
contacted me via email and told me that for part of the orbits, they are
switching to the S band for testing and the VHF beacon is off during this
time. I thought it was on all the time - I didn't realize the power
budget was that tight. I know the big solar panels aren't rigged out till
the final orbit is achieved, but when they are there's a lot of power
available - I thought that unfurled there would still be enough to run a
couple of beacons and maybe a transponder like they've hinted at. Every
time I had listened for the satellite in the past the beacon had always
been there, loud and strong. So it was a shock to find it missing. :-)

Thanks for the help folks. Anyone know what phase in the orbit they do
the S band testing on?

Also, one fellow clued me into subscribing to the AMSAT-BB mailing list
to get the most current info. Thanks again

Kevin, WB2EMS.

I have just tried a product I found at the Hardware store, "liquid electrical tape". Smells and looks like plastic pipe solvent, but it is black and the label has only some ingredients in common with the plastic pipe solvent I had. I coated some coax / antenna joints with it. Did not disolve the coax (solid) core or jacket. I was able to soak it into the exposed braid. I think I got a pretty good seal. It was better than rubbing silicone caulk into the connections.

When did you record it? Just before you tested and posted that message?
I noticed after replying to you and listening myself, that the sat was
in ranging mode at that time and there was a message that IHU-2 was being
uploaded (by G3RUH). At that time nothing was being decoded.

You can recognize this state because there is only a very continuous
"tonal" sound with very short "rasps" in it. What you should normally
hear is a steady sound of about 4 seconds followed by about 10 seconds
of "raspy" sound. The tone of that 10 second interval heavily depends
on the actual data being sent. Sometimes there are long runs of 00 or
space bytes, which sound quite tonal as well.

You can easily recognize these states in the waterfall: zeroes is seen
as two lines that should align with the red lines, the 4 second sync
interval is seen as two groups of about 4 lines grouped around the red
lines. When you see only two lines over very long periods of time, the
is no telemetry being sent.

>How should the "Phase" indicator behave - lock in on a couple of positions and
>switch back and forth? Mine just flickers all over the place. Is there some
>useful pattern to look for here, that indicates a good "lock" on the signal?

The phase indicator was very flickering in the first two versions and
seems a bit more steady in the 0.3 version. It should flip back and forth
between 12 o'clock and 6 o'clock, but in practice it will also jump to
other places. I feel the waterfall is more useful as an indicator than
the phase display.

>I usually just want to know the time of a pass and the maximum elevation,
>and maybe the azimuth at LOS and AOS.. the only additional information
>from the graphical display is the footprint.

THe graphical info may not be required all the time, but it certainly is
useful with new satellites, especially in elliptical orbits, to get some
idea about the orbit, and indeed the footprint.

When I started using satellites, we were all using the W3IWI Basic Orbits
program. This essentially printed the same lists that today's programs
print in "prediction" mode. It would surely have been easier when there
were some graphical helps at that time.
(but the computers I used had only very limited graphical capability)

I also like the antennatracking and dopplertracking features in SatTrack,
supporting multiple transponder and beacon frequencies. I used that to
run a fully automatic kitsat/uosat station for some time.
It even switched coaxial relays (antenna selection) and put the antennas
back in a default position and transceivers back on terrestrial packet
frequencies after each pass...

Of course you could program something yourself using the socket feature
of predict, but it would be another program to put somewhere on the screen.

Source record: 7588

Well, still no luck. Maybe the recording I'm using is at fault. If I could get home from work earlier, I'd try to decode the live data. This "job" thing always gets in the way of the important stuff!

How should the "Phase" indicator behave - lock in on a couple of positions and switch back and forth? Mine just flickers all over the place. Is there some useful pattern to look for here, that indicates a good "lock" on the signal?

thanks again

don

I am giving you an entirely biased answer...

TMD700A is the radio I mean THE RADIO you should buy. I spent big bucks
for one and liked it so much I went out and bought a used one on ebay
and saved $150 plus tax. It doesn much much more that it advertises.

check out this site and look for the complaints. OKAY some intermod but
what wideband radio doesn't have intermod problems?

Hi, all.......

OK, I understand the VHF telementry from AO40 is using PSK31, right? A couple of questions.......

This is the same as HF psk31?
Do I open the squelch all the way on my receiver, or will it break the squelch and decode it?
What VHF frequency?

Thanks much for any help,
Rick N9GSU

Rick,

No, AO-40 is using 400 baud PSK. There are a few hardware decoders around, as well as some sound card units. I have a hardware decoder, but you can look at http://www.ccr.jussieu.fr/physio/amsat-france/eindex1.htm which has both a DOS and a Windows version of a sound card unit. Also try http://iz8bly.sysonline.it/P3D/index.htm for another version. Be aware that these are early version, so the docs and in some cases implementation may not be complete. Have fun!

Digipan is good for psk31 but AO-40 does not use that mode. While it
does use a form of PSK, the PSK31 is not the correct one.

Look here for some more info on the AO-40 mode.

http://www.ccr.jussieu.fr/physio/amsat-france/eindex1.htm

AO-40 does NOT use PSK31 .. It uses a form OF PSK that is entirely
differant.

Look here for some info.

http://www.ccr.jussieu.fr/physio/amsat-france/eindex1.htm

You can get a sound card program from www.amsat.org and their downlod
files. Look under AO-40 instead of the download files section.

You need to use the ssb mode on the recever and will have to do some
tuning to get it correctly tuned in. I would unsquelch the receiver to
do this.

Wrong. It is PSK. If you would compare it to PSK31 it would be PSK400.

I thought so also until I read that the secondary receiver is AM or FM
only. Apparently will not monitor a ssb/cw downlink while you transmit
ssb/cw on the uplink. Hope this proves to NOT be correct, but.....

Pieter,

I just spent a little time looking at the Project Spacetrack report and at the Fortran code that I use for predictions. I think the easiest thing to do is to compute the osculating Cartesian elements using the SGP4 model and then compute the mean anomaly from these elements. That way you'll know that you have the value you need, and you won't be depending on a variable that may not be the actual osculating mean anomaly.

Tim

3185. UPDATE on Mirage B3016 preamp

Newsgroup: rec.radio.amateur.space
Date: 2000-12-02 00:00:00 UTC

Thanks to all that offered suggestions concerning my preamp. I liked the sound of Jonesy's suggestion (W3DHJ), which was to yank all the preamp components on the original board and wire in a hamtronics preamp. Well, that's what I did, and it's fantastic. I installed it in the amp box last night and tested it on the bench, then installed it on the tower today and tried it out for real. Awesome results! You have got to love that kind of gain! 73 de KA1STZ Gerry

helmsman,

Thanks for the heads up.

Did you look at the legislative history of MCL 750.508? It was enacted in 1931, eleven years after the passing of the 18th amendment to the US Constitution which, for all pratical purposes, outlawed intoxicating liqours. The 18th amendment was repealed by the 21st amendment in 1933, two years _after_ MCL 750.508 was enacted. It looks as though dodging the cops was a major issue after the ratification of the 18th amendment (duh!) and Michigan tried to curtail cop-dodging by making it illegal to install police receivers in cars. The Michigan legislature has amended the act three times since then, probably to keep pace with changes in amateur radio licensing.

Does anyone know offhand the history of changes to the amateur radio license structure? MCL 750.508 was amended in 1939, 1957 and 1990. Did the FCC change the amateur licensing structure shortly prior to these years?

THis has been discussed a lot... why do you (like so many others) assume
that the primary receiver will not work while transmitting?
Other satellite rigs have only one receiver and they can do fullduplex, why
would that capability suddenly disappear once a second receiver is added?

So: you put that secondary receiver on your local repeater or chat channel,
and forget about it. Use the primary receiver for the satellites.

3190. Listening to AO-40

Newsgroup: rec.radio.amateur.space
Date: 2000-12-03 00:00:00 UTC
From: Elisa Meara <wmeara@clix.pt>
Message-ID: <3A2A56E0.AEF@clix.pt>
Source record: 7525

I'm not yet set up to decode the telemetry from AO-40, but I was so enthused by the successful launch that I threw together a very low tech/old tech listening station. The antenna is a vertical dipole with a mast-mounted Ramsey Kit pre-amp. Next there is a Hamtronics 2 to 10 meter converter. That goes to my old reliable Drake 2-B.
For tracking, I'm running the old Orbits II program on an old 286 machine. Like I said, old-tech/low tech. It's ugly, but it gets you there.

I've been listening to the satellite on and off from about 0733 UTC 3 December. Signals were very strong when the range was 15,000 km and I observed a decline in signal strength as the range increased. Several times I thought the bird had moved out of range, but then I'd pick up the signal again. I'm noticing some fairly large variations in signal strength. Any ideas on what is causing this? What kind of antenna are they using to send the 2 meter telemetry?

The satellite is spinning around its Z axis 6 times per minute, i.e.
once every 10 seconds. That is done to keep it stable during the
upcoming motor firing. Once in final orbit the satellite will be
3D stabilized, i.e. it will no longer spin.

The telemetry is sent into an omni antenna (about 15 watts output).

Also when you receive with an omni antenna you will see the vertical
radiation pattern when the satellite climbs to higher elevation angle
(or descends back). A higher-gain vertical may have several lobes
in this direction, but will work best when the satellite is near the
horizon. For optimal results you need an antenna that has a suitable
vertical pattern, or that is pointed to the satellite.

3196. OSCAR Rcv/Txmt Adjustment Protocol Check

Newsgroup: rec.radio.amateur.space
Date: 2000-12-03 00:00:00 UTC
From: Bob Morehouse <nobobmorespam@pacifier.com>
Message-ID: <3A2ACC53.9ECD74C1@pacifier.com>
Source record: 7531

This relates to the what is considered the accepted practice for tuning your vfo when on the satellites. Per an AMSAT book I got some years ago, "How To Use The Amateur Radio Satellites", fifth edition, it states:

"Common practice during a satellite QSO is to slowly shift your transmit frequency on the uplink as the Doppler effect changes the frequency of your downlink signal. This will also prevent an inadvertant shift of your conversation into someone else's."

I was on FO-29 earlier today with a fellow back east who said you should do it the other way around, adjust the reciever to stay on the transmitted frequency. Has the previously accepted practice changed, or is this fellow simply not informed on the way it should be done? As the book said, it seems like you will eventually drift into another QSO, and actually, you'll run out of passband to even have your own signal downlinked.

By the way, for those of you who have all-mode VHF/UHF gear who have been hesitant to try any of the satellites just because you don't have directional yagis on dual-axis rotators, I've been on AO-10, FO-20, and FO-29 a number of times since early last month using vertical antennas. FO-29 has had some real good signals, but hardly anyone has been on that one. I have 2 meter/435 crossed yagis, but they need a quite a bit of work.

Those keps are bad. You need older keps, not newer.

The keps for day 328 were OK.

It seems a better idea to use a soundcard and one of the available software
demodulators.
If you really want to use hardware, get the G3RUH demodulator from Amsat.
(it does not require a TNC, has direct serial output)

Is anyone out there using the DSP-93 and the W4SM P3T telemetry decoding software? I have been able to receive packets fairly well but I have yet to see a "CRC OK" in the decoder.
Should this work with this setup? How do I interpret the LED's on the DSP-93? It would appear LED1 is ON if the unit is successfully decoding something and hence sending serial data to the computer. Even when this happens however, I often see nothing in the data on the computer. It as if the port is closed. If I toggle around on the various text block
types, the software "wakes up" and starts getting data however CRC never changes. Is this

normal? I am eager to start logging this stuff and the logging function appears to not work without CRCs.

The vast majority of TLEs are the result of orbit determination by Norad (now called USSPACECOM). NASA distributes them as mandated by Congress. Norad may either be mislabeling the object or they may not have scheduled tracking on it recently. Since Norad tracks most of these objects using radars, they may have trouble associating the objects from a launch with the correct name of each piece. NASA has no way (for most objects) of quality assuring Norad's work.

Some science missions use Norad TLEs to avoid the cost of tracking services and orbit determination. At least one (to my knowledge) found out that Norad mislabeled their spacecraft and placed a very low priority on correcting the error.

I have "heard" the rig can only do 23 cm TX, no 23 cm RX, since 23 cm is
only used as a satellite up-link frequency. Is there any truth to this TX
ability only on 23 cm?

Yes, the 335 Julian date keps were bad. This morning I switched to the 328 Julian date keps and got AOS exactly at the time predicted. I also went back and checked at LOS for yesterday evening (1806 UTC) and with the older (328) keps LOS was exactly on schedule. Thanks for the good advice. 73 Bill CU2JL N2CQR

I no longer live in Michigan, but my friends that do tell me that this bill has been dead for about a month now. IIRC, it never made it out of committee.

I would say no, it's not FO-29, that sats center freqency is 435.910,
too far down for doppler shift.

NASA is confusing objects. I guess these strange elliptical orbits
are out of their everyday experience. Use this set from
http://www.amsat-dl.org Don't assume that the most recent from NASA
is the best.

AO-40 / OSCAR 40
1 26609U 00072B 00328.20006944 .00000001 00000-0 12451-4 0 45
2 26609 6.4214 245.2971 7351666 180.5141 180.0042 2.03021569 166

When AMSAT starts firing engines everythinh will change again of course.
Just keep visiting the amsat-dl site.

>Norad mislabeled their spacecraft and placed a very low priority on
>correcting the error.

Amateurs have a long standing experience with tracking problems at NORAD.
They usually are on launches with a lot of payloads, and almost every time
there has been confusion about which element set is for what object.
And when it finally is OK, it gets mixed up again at the next TLE issue.
(happened this time as well)

It has been ironically remarked that these are the same guys that are
supposed to track hostile objects launched from enemy countries. Those
supposedly are not fitted with identifying beacons either...

History shows that it is easier to track an object than to identify it
as friend or foe.

3218. Help with P3T TCP/IP & IZ8BLY Phase3D Satellite Decoder

Newsgroup: rec.radio.amateur.space
Date: 2000-12-05 00:00:00 UTC
From: Alan Grove <zl70@dial.pipex.com>
Message-ID: <90jgce$h4r$1@lure.pipex.net>
Source record: 7456

Is there anyone out there who could assist me with making W4SM's P3T program work with IZ8BLY's Decoder program?

I have been using the IZ8BLY program successfully to decode the PSK 400 signals being received on 145.898MHz from Oscar-40.

I have also used W4SM's P3T program to connect successfully to remote telemetry servers via the internet.

However, I cannot get the two programs to work together as a local server and client on my own computer.

Obviously I have TCP/IP installed for use on the internet, but clearly there is something wrong with my setup.

I have followed IZ8BLY's instructions for setting up the TCP/IP remote client part of P3T. However, when I click on the "Connect" button on P3T, I get the message:

Windows Socket Error: (11001), on API 'ASync Lookup'

If I try a second time I get the message:

Windows Socket Error: (10049), on API 'Connect'

If anyone could assist me in overcoming this problem, or even direct me to a source of information, it would be appreciated.

Alan, G8BJG

Hi all,
I have a copy of PC Track 3 and am trying to use it to track the new AO-40.
I like its interface and display, but apparently it is not Y2K compliant.
It is in error by quite a bit.

Does anyone know of a patch or other correction for PC Track 3.
Thanks

I am still using PC Track 2.14 (I prefer the screen layout over all the others), and it too has a problem with Y2K. You might have the same problem...

The program imports the keps, and saves them in its own internal format. Unfortunately, the century is stuck at 19, so all of the 2000 elements show up as 1900. Go into wherever the 'edit keps' menu is; if you see the incorrect epoch year, just manually override it. You'll need to do this every time you import the elements. Not a big deal.

Good luck,

Greg.

What did you tell P3T to use for an IP address? The instructions
said something about 127.0.0.1, but that didn't work for me. I
ended up trying the machine name, and that worked.

Good luck. The two programs are a great team.

Greg.

Protocol as I understand it is actually to adjust the HIGHEST
FREQUENCY signal...so on AO-10 you'd adjust your TX, like you've
quoted, but on the Fuji Oscars you'd adjust your RX. Supposedly this
minimizes the total adjustment (in Hz) needed to compensate for
Doppler.
So by what I've read, both are right, in this case!

http://www.heavens-above.com

is indeed an impressive piece of work but it is
not the ideal source to check things. The elements
it uses are from NORAD, and grabbed blindly.

When using it to look at AO-40 for example I
noticed a serious error. It said that the bird was
in earth shadow (dashed line) when the subsat
point was in the light. This is not possible.
There are other anomalies but I won't list them
all. This is a site to have fun with and probably
not trusted completely.

SAUDISAT-1B
Uplink to be released
Downlink 436.775 MHz
Launched September 26, 2000 aboard a converted Soviet ballistic missile from the Baikonur Cosmodrome
Status: Commissioning stage, initial housekeeping tasks underway

SaudiSat-1B will operate as 9600 baud digital store-and-forward systems as well analog FM repeater mode capability. One of two new ham satellites from the Kingdom of Saudi Arabia built by the Space Research Institute at the King Abdulaziz City for Science and Technology.

From: "Turki Al-Saud" <talsaud@kacst.edu.sa>

Subject: [amsat-bb:33530] SAUDISAT-1A,B
Date: Fri, 28 Jul 2000 17:23:01 +0300

Dear Gentlemen,

The first Amateur Radio Satellites from The Kingdom of Saudi Arabia are presently being built by the Space Research Institute at the King Abdulaziz City for Science and Technology in Riyadh. Tentatively set for launch August 25, 2000, these satellites will be capable of 9k6 digital store and forward operation (Packsat Broadcast Protocol compatible) as well as FM bent pipe mode.

These satellites will use the following downlink frequencies. Uplinks are in the VHF band and will be announced after commissioning.

SAUDISAT-1A SAUDISAT-1B
Downlink 437.075 436.775

Amateur Radio is in its infancy in Saudi Arabia. With these satellites we hope not only to add satellites to the space resources available to hams world wide, but to increase the awareness of the value of Amateur Radio in the Kingdom.

Dr. Turki Al Saud
Director, Space Research Institute.
King Abdulaziz City for Science and Technology.
Riyadh, Saudi Arabia.

Hello Ken

Unfortunately you have picked the wrong program. The author has been out of
circulation for about 4 years (maybe he is no longer with us). There are many
other good programs - try David Taylor's freeware:

www.satsignal.net
Look for the 'software' link.

Lawrence Harris

>> (or in fact, I am converting an existing 56K program by SP9VRC to C)

Hi Bob,

Yes, he beat me to it. I am now using his program... mine is still
not finished and probably will not be, unless someone would claim that
SP9VRC's algorithm is better for demodulating.

There are, however, some minor problems with Thomas' demodulator:

- it requires very many auxiliary libraries. I had to go back to my
installation program 3 times to add more packages before it could be
compiled and run. I have never seen so many libraries listed by ldd...
it even uses an XML library! the packaged version requires the
very latest version of RPM, which most people won't have. as a whole,
it has a considerable installation hurdle

- when I compile it with MMX enabled, it does not work. CPU usage is
much less, but it never leaves "SYNC HUNT" state. (Intel P233MMX)

- there is 0.0 documentation. it looks like it was generated from a
standard framework that included some example documentation files,
but they are empty or contain only generic remarks

- it decodes packets, but only text. In the latest version there seems
to be an interface to the external world, but it again is undocumented.
I would like to send the output to P3T, but that expects a TCP
port to connect to, and this interface seems to be using UDP.

- the scrollbars in the data windows don't track the output, so one has
to drag them down using the mouse for every packet received.
I already do suffer from RSI...

- the version of the program on the site changes while the version number
and listed file sizes remain the same...

To avoid sounding too negative, there also are some advantages:

- it seems to be the best demodulator of the four I tried. it gives many CRC-OK results when the Italian and French programs have long lost sync. psk400.exe does not work at all here.

- it is open source

Unfortunately the whole thing is too complex to make quick fixes to obvious problems. So it will again require more time to study, and I already have spent way too much time at this...
(the downlinked info is pretty static, not that exciting to watch after the first couple of days)

Rob

What's not true? That the power budget is tight or they turn off the V beacon while using other transmitters? The spacecraft certainly has less power available now with the solar panels still stored.

3236. Re: Help with P3T TCP/IP & IZ8BLY Phase3D Satellite Decoder

Newsgroup: rec.radio.amateur.space

From: Alan Grove <zl70@dial.pipex.com>
Message-ID: <90m77n$2ip$1@lure.pipex.net>
Source record: 7472

Greg,

Thanks for that, it did the trick.

I had been using 127.0.0.1, as per IZ8BLY's instructions. Once I changed it to the machine name the P3T program responded with "Connect to: unknown server". At the same time IZ8BLY's program showed that it was "Connected to: 127.0.0.1".

The only snag is that at the present time AO-40 is somewhere over the Pacific Ocean. However, I have tested the setup with a wave file from AMSAT-F, and all appears to be working well. I shall try it for real tomorrow morning.

So thanks once again Greg, that has put an end to a frustrating situation.

Alan G8BJG

PS I have also tried it with KD3NC's PSK400 program, which is a simpler version of IZ8BLY's. This also seems to work ok.

Both are not true. The powerbudget is enough to support the beacon and the
magnetorquing, and they don't turn off the V beacon while the S beacon is
on. The mode S period has even been extended.

Of course there is less power in spin mode, but remember the high powered
transponders and the ATOS engine are off. And so are many other
experiments. It seems CEDEX is the only "hungry" experiment running.

Well I got my two Fod Track boards running tonight. Finished assembly 3 nights ago, but they didn't work initially. Debugged the last couple of nights and got it solved tonight! So far I have just used the Fod track program, and I need to finish calibration, but they work! I am psyched! :)

Anyone else got theirs working?

Jim,

Did you get the answer to your question? I played with the Makefile until my fingers bled and couldn't get that thing to compile. Finally, I dusted the cobwebs out of the programming part of my brain and did some digging. Here are my changes to get SatTrack compiled under Slackware 7.1. My Makefile is attached, too.

#
#-------------------------------------------------------------------------
#
# MACHINE CONFIGURATION (TO BE SELECTED BY THE USER)
#
#
# The four lines with 'CPU', 'CC_CMACH', 'CC_LMACH', and 'CC' need to be
# activated for a particular machine on which the code will be compiled and
# linked. 'CPU' is used only to tell at link time what machine is selected.
#
# If the Gnu C compiler is not available, set 'CC to 'cc' instead of 'gcc'.
# For a very rigorous compilation the flags '-Wconversion' and '-Wall' can be
# added to the 'CC_CMACH' line when using 'gcc'.
#
# The flag 'STDLIB' is used to NOT include 'stdlib.h' explicitly, because in
# some systems like SunOS 4.x.x 'stdlib.h' is included already somewhere else
# by default. Be aware that there are three different configurations for these
# five lines for Sun SPARCstations, especially when using 'gcc'! If this is
# not set up correctly, the 'atof' function will not work right.
#
```

```
# The flag 'TIME' is used to NOT include 'time.h' on a Sun-3 with SunOS 4.x.x.
#
# The flag 'TERMIO' is needed on IBM RS-6000's and HP Apollo 9000 Series 700's
# in order to include 'termio.h' instead of 'termios.h'.
#
# The flag 'HPTERM' is used to include the cursor control sequences for an
# HP terminal as opposed to a VT100 type terminal.
#
# If SatTrack is compiled under FreeBSD, the flag 'FREEBSD' needs to be set.
# In this case 'IOCTL' needs to be included as well in order to add
# 'sys/ioctl.h'. The latter is also true for the compilation on DEC machines.
#
# For the X Window system (X11R5 or X11R6) a few more line needs to be
# configured properly (see below in the following two sections).
#

# Sun-3 (Sun 3/80 with SunOS 4.x.x)

#--------------------------------------------------------------------------------
#
# OTHER COMPILER FLAGS (TO BE CONFIGURED BY THE USER)
```

```
#
#
# HOMEDIR uses environment variable HOME to create directory names
# (if undefined the variable SATDIR in 'sattrack.h' is used)
# (also see below!)
#
# SUNTRANSITS allows calculation of satellite transits in front of the Sun
# (this does not affect the batch mode for transits)
#
# REVERSEVIDEO allows display of reverse video and underline characters
# (if undefined, normal video is used always instead)
#
# NOBEEP allows the beep (bell) character to be suppressed
#
# VISIBPASSES predicts only those passes in the short prediction table of
# satellites that are visible. If '-DVISIBPASSES' is not
# included, also daytime passes will be predicted. The columns
# in the predictions tables are optimized for either visible
# observations or radio communications.
#
# XWINDOW For using the X Window graphics display this flag needs to be
# included. If the X Window system (X11R5 or X11R6) is not
# installed, or if the graphics display is not to be used, the
# option '-DXWINDOW' has to be deleted. If this flag is included
# the user needs to make sure that the location of the X11
# directory with the X11 header files is set properly in the
# include option (see below in the section 'COMBINED COMPILER
# AND LINKER OPTIONS').
#

#CC_CUSR = -DHOMEDIR -DREVERSEVIDEO -DSUNTRANSITS -DXWINDOW -DNOBEEP
#CC_CUSR = -DHOMEDIR -DREVERSEVIDEO -DVISIBPASSES -DXWINDOW
#CC_CUSR = -DHOMEDIR -DREVERSEVIDEO
#CC_CUSR = -DREVERSEVIDEO -DXWINDOW
#CC_CUSR = -DHOMEDIR -DREVERSEVIDEO -DXWINDOW

CC_CUSR = -DREVERSEVIDEO -DSUNTRANSITS -DXWINDOW

#
#-------------------------------------------------------------------------
#
# HOME DIRECTORY (TO BE CONFIGURED BY THE USER)
#
# If SatTrack is not to be installed under $HOME (which is the default), then
# HOME needs to be changed to where SatTrack is installed. The same change
# needs to made to the shell scripts 'gettle' and 'getsts' in 'SatTrack/run',
# and also to SATDIR in 'sattrack.h'. Do not forget to remove the comment sign
# in front of 'HOME' below.
#
# This is also the case if SatTrack is installed in someone's home directory,
# but should be accessible by other users as well.
```

My impression is that in the PC world they are moving exactly the opposite
way. Away from "intelligent" devices like external modems, printers with a
well-defined interface, SCSI peripherals that operate by themselves and
communicate over a standardized bus.
More towards "dumb" devices that are controlled by software running on
the main processor: winmodems, winprinters, IDE peripherals.

And for a good reason: main processor "power" is available in excess,
and it is cheap. Control software runs in RAM and can be easily updated.

>like the stand-alone, dumb terminal interface of the DSP2232, this is what

>Linux. In fact it is the only device that has lasted through all the
>upgrades. It works very well, even with its old technology. I think he is

Of course that is a disadvantage of dumb devices. They require driver
support, and every upgrade or move to another OS is a risk. But it looks
like the de-facto monopoly situation on OSes provides a stable enough
basis for devices like this to sell.
(at least to those who only care about purchase price and not so much
about technical merit)

>correct in the fact that the DSP2232 needs a "Millennium Update", new

>You could do this with a TNC, a rotor, GPS unit etc. That is a real step
>forward, whether it uses a Z80 processor means nothing. After many years
>programming computers I have realized that all bytes have 8 bits.

It was not me but the manufacturer of the DSP2232 who claimed that its
parts were obsolete. This is of course a problem when you want to run
a production batch.
My suggestion was to have a USB interfaced box. This needs some CPU
to be able to function (that is how USB works). It of course also would
need the DSP, or else it would not be a product (it would be like a

USB sounddevice with a rigblaster).
To have all the other "intelligent" features in it will just drive up the price. It will only be bought by those that perfer SCSI over IDE, or an oldfashioned external modem over a winmodem. Sure there is a technical advantage, but most people will not like the price.

The ICOM CI-V bus is nice, but it is only usable for control. It cannot be the interface between a transceiver and DSP box the way it is done now. But of course it would be possible to use that same bus to control a rotor or readout a GPS. I don't know why rotor control boxes don't use CI-V, maybe because they happen to be made not by ICOM but by another manufacturer.
GPS receivers of course have their own standard, being sold primarily outside the amateur radio world.

The idea of having one universal bus that is used by many different industries and markets is appealing, but the computer industry is deliberatly moving around that target. They could have adopted TP Ethernet for the purpose that USB is now serving, and they didn't. An Ethernet interface was already available on or for most systems at the time USB was invented, and apparently that is not what they want. Other USB-like interfaces have existed before (e.g. HP-IL). Still, a new standard was defined and it will probably be replaced by something else in due time. It looks like they don't like you to gradually build up a system and seamlessly integrate a new box with stuff you've had for 10 years.

Rob

3242. Re: Fod Track up and running!

Newsgroup: rec.radio.amateur.space
Date: 2000-12-07 00:00:00 UTC
From: Gerry <ka1stz@yahoo.com>
Message-ID: <t2us7u1tu00aa0@corp.supernews.com>
Source record: 7478

It's a tracking interface to go between a computer and az/el rotor. Then,
by running a software program the antennas will track an orbiting object
automatically. KA3HSW organized a group board buy here over the
ummer. -Gerry

snip
IDE drives have a "whole bunch of smarts" when comapred to the first
MFM 5&10 meg hard drives.
Or the better modems (no wincrap) have rather powerfull CPUs and can be
"flash" upgraded. My old 28.8 Supra could be flashed to (I think) 33.?.
A friend (who worked at IBM) commented that "no one realized just how fast
small CPUs would get cheaper and smarter. These days my MS "Natural" keyboard
has its own CPU, My Video board has an on board CPU, as does my modem,
and my Ensoniq "Soundscape" has a power CPU/DSP chip set(that no one bothered
to write code for). And not all printers have gone toward the brains in the
PC. My wifes new HP has the smarts in the printer. Oh, and her scaner even has
it's own CPU and we are trying to decide if we want to "flash" it "OS".
After all it works great, and I have had several "flashes" fail. I think the
higher end "add ons" are much more likely to have "smarts" onboard while the
el-cheapo stuff lets the PC take the load. Like always, you get what you pay
for.
One comment, both USB and "fire wire" can really hog PC CPU clock cycles.
I have a "Matel/Intel" USB microscope that kills a friend HP Pavilion
when you plug it in. But on my system, a "no name" homebrew it has almost no
effect.

3244. Re: DSP-2232 New Modems???

Source record: 7480

You have to ask yourself one question? If all devices had an onboard computer how important would an OS be? Now ask why did Microsoft pump tons of money into IE? Why did Microsoft develop its own PDA OS? The major players in the OS market DO NOT want smart devices or programs that are OS independant! They want devices that they control the lifespan of. For instance, a winmodem is only good while it is supported and the OS is maintained. Compare that to an external modem that will be around as long as we have serial ports and those days are numbered. I saw the first computer without one the other day at a computer show, that one had USB only. It's the 3 M's Microsoft, Monopoly and Money!

About appliance devices, look at Sony they have a long history of providing appliance type devices for professionals and home users. People buy them! They do not buy the device then the software to run on it, there is no required upgrade, they just work!

Imagine what there would be if we had better standards that made the OS a commodity, like orange juice. Now imagine an industry without M$. I think the consumer would be better off in some ways. They would focus on the tasks that they bought the computer for instead of how to deal with GPF's and constant upgrades.

I have covered a lot of ground that takes us away from the DSP2232.

Rob Kling

I am waiting for a manufacturer to place DSP2232 like hardware inside of a radio!

Joke: I hear the Gates people have a new OS for the Floridian voters to use at the poles .
When it fails, it dimples all your chads and gives a general election fault .

3245. Re: Unable to decode AO-40 data

Newsgroup: rec.radio.amateur.space
Date: 2000-12-07 00:00:00 UTC
From: N1RZ <n1rz@timhavens.com>
Message-ID: <9HQX5.5029$Dy6.252913@news-east.usenetserver.com>
Source record: 7481

N1RZ here....

Don, what audio file of AO-40 are you talking about? I don't think I've got any such recording on my site at this point for AO-40. I can't remember....but I am pretty certain I don't have one posted.....

There are a LOT of folks that are running streaming live audio of AO-40 now.....

Here is an email I got recently listing several Internet Live audio links....

All

The PSK-1 P3T server on 194.222.101.137:1024 seems to be working better than previously. However I do have to switch polarization on the antennas on occasion during the day. As you can appreciate I'm at work so I can't always do this quickly.

The 194.222.101.137:1025 server is an IZ8BLY decoder and I am having difficulty keeping this tracking correctly. Again, being away from the shack while AO-40's up it's proving difficult to track the faults.

I'm suffering a great deal from local QRM at my QTH (Central London) during the day so the quality of the data can be quite bad quality at times. Early morning seems OK.

The http://194.222.101.137:1033 audio/video feed seems to be working OK, although can be a bit clunky. Remember to open in Windows Media Player, not a browser! Keep in mind that this is often swithced off when AO-40's not overhead or I'm fiddling with something in the shack, which may be being done remotely so I need the bandwidth!

Radio Meteor Observation Bulletin No. 88 December 2000

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Paseo Bonanova, 8 Barcelona (02 07'E, 41 24' N)
Frequency: 48.24715 MHz.
Transmitter Location: Biedenkopf C2 TV, Video Frequency 48.250 MHz,
ERP 100 kW, Azimuth 90 +/-65
Antenna: 3 element Yagi Azimuth 200 deg (NE), elevation 20 deg
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (500 Hz) and fed into the PC in real time.
Data sampling system: own written software "MSD" with sound card.

Notes:
. ? probably affected by sporadic-E or FAI
. 10 min counts are available for other periods besides the ones listed here

Enric Fraile Algeciras
```

Observer: Jean-Louis Aillaud
Location: Sainte Clotilde, R&#65533;union Island (55 29' E, 20 52' S)
Frequency: 87.7 MHz, remote transmitter on Madagascar - distance 850 km
89.7 MHz (empty frequency for coincidence)
Antenna : 3 elements Yagi FM horizontal polarisation
elevation 90 deg (zenith), astronomical azimuth: 114 deg (=West)
Receiver 1: FM tuner Technics ST G 450 L (on 87.7 MHz)
Receiver 2: FM tuner TEAC TR 400 (on 89.7 MHz)
observing method:
a) electronic interface on LINE output audio signal are fed in
COM2: of PC (1) 100 MHz and COM2: of PC (2) 200 MHz
b) METEOR V4.0 processes the signal and records on hard disk the
time of the events.
METEOR parameters: threshold 10 for 87.7 89.7 MHz
c) COLORGRAMME V.2 for examined DATA and generates RMOB bulletin
automatically.
COLORGRAMME parameters: sum freq 3000

Observer: Michael Boschat
Location: Halifax, Canada (63 36'W, 44 39'N, 58 meters above sea level)
Listening Frequency: 83.24 MHz
Receiver: Icom R-10
Antenna : resonant dipole
Antenna Direction: Horizontally polarized with lobes in E-W plane, elev 0 deg
Filter : high-Q (Q at least 300) bandpass filter between antenna & receiver.
Listening Mode: CW
Recording method: listening by ear
```

Notes:
. A fairly good month especially the Leonids! I got one photo from my
balcony and have put it on my web site:

http://www.atm.dal.ca/~andromed/pics/Leonid2.jpg

. no corrections for radiant position made to the counts
. - = no observations made

. * = Interference

Mike Boschat

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi (x form), 4 elements, astronomical azimuth 270 deg
(= E), elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB.
SWR of antenna alone at 66.5 MHz: 1.4/1 (good to very good),
measured with MFJ/259P SWR analyzer (HF-VHF 1.8 MHz to 170 MHz)
on Sep 28, 1998.
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the Ghent University format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

November 2000

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:
. Nov 3-5: man made interference
. ? probably affected by sporadic-E, tropo, direct reception.
. * warning for relative high number of long duration reflections,
an indication for potential stream activity.
. local time = UT + 1 hours
. changed trigger level to 20 AD counts starting Oct 2000 (previously
15 AD counts since the start of the observations in 1993).
As expected this setup is less sensitive to (low volume) interference.
Correction: trigger level was previously 15 AD counts, not 6 as mentioned
in RMOB0010 (the signal level is 6 to 7 in quiet periods).

Maurice De Meyere

Location: Astronomical Observatory, Ghent University, Belgium
(ED50 coordinates: 3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation 20 deg
Antenna amplifier: 10 dB gain
narrow band resonance lambda/4 antenna filter
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Location: Roden, Netherlands (06 26' E, 53 08' N)
Frequency: 55.275 MHz
Transmitter: Spanish TV channel E3 (video); transmitters in La Muela (30 kW), Gamoniteiro (50 kW) and Aitana (60 kW); all stations within 100 Hz of nominal frequency; distance ~ 1500 km
Antenna: 3-elements horizontal Cushcraft 50 MHz Yagi tuned to 55.3 MHz; geographical azimuth 210 degrees (SW)
Receiver: Yupiteru MVT-9000 in USB mode; sensitivity 0.5 uV at 12 dB S/N
Observing: 800 Hz audio signal from ear-phone socket was rectified, digitised and fed into a PC via the parallel computer port. HP VEE was used to process the digitised signal and to store 15-minutes counts of reflections stronger than 0.22 uV (-120 dBm). Also for all individual meteors date, time, duration (dead time) and maximum signal are stored.

Uncorrected hourly counts for signals stronger than 0.22 uV starting at:

Notes:
. - no observations
. * counts affected by long duration echoes
. Due to many long duration echoes caused by fast and bright meteors, the counts are not a good measure of the activity of the Leonids during the peaks on 17 and 18 November. For those periods the dead-time percentages given in the second table are a much better indicator instead.

Ton Schoenmaker

Observer: Dave Swan
Location: Christchurch UK (50.47 N 1.44 W)
Receiver: Pro 2006 (modified to give a carrier detected
output for Chessell 301 pen recorder).
Sensitivity NFM: 0.5 uV (S+N)/N = 20 dB Dev: 3 kHz
at 1 kHz BW 9 kHz. Calibrated: 1/05/00
Antenna: 4 element Yagi broadband design for 50-70 MHz Gain 9.2 dBi.
Azimuth 95deg elevation 8 deg. Two 3 stage constant K
filters fitted after the antenna, (High and Low pass)
to reduce out of band interference and
intermodulation products causing spurious meteor counts.
Frequency: 62.203 MHz
Transmitter: Flensburg TV
Computer: Olivetti 386 Notebook with Meteor v 4.0 software

Note:
. the November 3-21 counts were on the backup system.
Back up system: Rx AOR 3000A, 4 element Yagi Az 56 deg El 8 deg,
Transmitter 62.203 MHz Flensburg. 486 computer and Meteorv4. .
. observations on 66.62 MHz had to be abandoned because of local RF
interference. A second frequency of 62.203 MHz (Flensburg TV Tx) was used
from 3 to 21 Nov. but was also abandoned because of interference.
Testing of the frequency 55.25 MHz enabled observations to start on the
15 Nov. prior to the Leonids. Measurements of the Leonids on the 17,18 & 19
followed closely the predictions of Robert McNaught and David Asher.
Antenna azimuth was favourable for the Leonid radiant at the predicted times.

Dave Swan

Observer: Ervin Szlanicska
Location: Leg, Slovakia
Frequency: 91.75 MHz
Antenna: 3 elements Yagi +amplifier, direction: SW
Observing method: Meteor 4 program, Threshold: 10

Number of meteors in one hour intervals

Notes:
. I built a circuit for Piere Terrier's Meteor v.4 program and it was the
first real observation of a meteor shower.

Ervin Szlanicska, via Szabolcs Kiss and Tibor Csorgei

Observer: Pierre Terrier
Location: Canet, France (3 36'E, 43 41' N)
Frequencies: 96.8 MHz (changed since previous report)
Antenna: 6-element Yagi FM, horizontal polar.
azimuth 0 deg (N-S), elevation 90 deg. (zenith)
Pre-amplifier: home made, gain 15 dB, Nf < 2 dB
Receiver: Tuner FM Continental Edison digital synthesiser TU 9945
Observing method: Electronic interface on LINE output audio signal are fed in
COM1: of PC IBM 386 25 MHz.
METEOR v 4.0 version processes the signal and records on
hard disk the time of the events.
METEOR parameters: THRESHOLD = 16
COLORGRAMME v 1.5 generates RMOB bulletin automatically

Observer: Garfield Tsao (BM2EQB)
Location: LonTan Observatory
LonTan, TauYan, Taiwan R.O.C. (121 14'37" E, 24 52'54" N by GPS)
Frequency: 50.0169 MHz USB mode 3 kHz width.
Antenna: Comet made 50 MHz Yagi HB 4 element (gain 10.3 dBi)
astronomical azimuth 225 deg (=NE), elevation 7 deg.
Transmitter: MIYAZAKI University Japan, USB mode, 50 W (24 hours),
distance about 1225 km from Lon Tan.
Receiver: Icon PCR-1000 computer controlled all band receiver
Sensitivity: 0.25 uV for 10 dB S/N for USB mode
Observing method: the beacon 920 Hz voice signal (by FFTDSP) is
received by a low frequency filter (900 Hz)and fed into
the D/A converter and computer in real time.
Data sampling system: using an 8 bits A/D card to PC/AT and Qbasic program
with 1/8 second sampling interval to store the> 1.0 s reflections.

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

3. ANNOUNCEMENT

LOOKING FOR HELP ON METEOR TRACKING

Date: 21-Nov-00 05:00 CET
From: "William E. Diggs" <wdiggs@mc.net>
Subject: AMATEUR METEOR TRACKING

Dear Mr. Steyaert,

This is a copy of a message that was sent to Mr. Pocock at the ARRL's "The World Above 50 MHZ" column.

As you can see from the e-mail, we are looking for information on meteor tracking using radio techniques. If you have any information that may be of assistance in this regard, please let us hear from you.

" I wonder if you may be able to assist us. We would like to set up a network of amateur radio meteor tracking stations to plot the path of meteors entering the atmosphere in real, or near real, time.

I have been given to understand that a small number of scientific researchers have been doing this, and that computer programs have been developed to help facilitated their efforts.

If you know of any hams actively involved with meteor tracking or, if you know of any who may be able to assist us in setting up such a program, or for that matter, would be interested in becoming involved with an amateur effort, please let me hear from you."

Thank you,

William E. Diggs -WB9NLI-

> ssb/cw on the uplink. Hope this proves to NOT be correct, but.....

I think there has been some mistake in the advanced publicity.
I have more up to date specifications.

The radio has full Sat capability
You can listen to two frequencies within the same band at once but only in
AM or FM
This is limited to 50/144/430/440/1200Mhz
Or receive all mode on any of the above bands plus receive 144/430/440 AM or
FM
using the sub band receiver.

If anyone wants a copy of the technical spec, e-mail me and I'll send it yo
you.
It's in PDF format so you will need Acrobat.

Regards

Drew

3249. Cure for P3Ddecoder errors

Newsgroup: rec.radio.amateur.space
Date: 2000-12-07 00:00:00 UTC
From: "Dr. Robert Suding" <robert@qadas.com>
Message-ID: <3A304256.AF5D0DD3@qadas.com>
Source record: 7485

I frequently find that no matter how I adjust the receiver or decoder, I just can't get rid of the obvious printout errors.

I finally found a way to get almost perfect printouts every time.

I use an SSTV program called ChromaPix that has a graphical spectral display appropriate to SSTV. I tune in the AO-40 telemetry on my Yaesu 736R so that the notch between the 2 frequencies falls on about 1600 Hz. (the SSTV Black frequency marker is 1500 Hz.) Then each of the frequencies will appear as a flat-topped band on either side of the notch.

However, I usually find that one of the bands is larger than the other. So then I turn the IF Shift knob on the 736R until I have equal sized bands on either side of the center notch. Then I turn off ChromaPix and turn on Nino's program. (Only one program can use the SoundBlaster program at a time).

I now put the program's cursor arrow on top of the fuzzy grey strip between the 2 frequency bands and I will have perfect copy even when the signal gets very weak. If doppler drift occurs, I adjust the receiver main knob to keep the red marker lines on the 2 carrier frequencies..

You should also check the telemetry audio level being input to your SoundBlaster card. Double click on the Speaker icon in the lower right corner of your screen. Then click on "Options", "Properties", and select "Recording" and click "OK". Make sure your telemetry audio level is all Green and one segment of Yellow. Adust the microphone or line input slider to raise or lower the VU display level. When done, turn off or minimize the slider display.

You can download a shareware copy of CPIX from
http://www.siliconpixels.com/cpix/cpdld.htm

3250. Re: DSP-2232 New Modems???

Newsgroup: rec.radio.amateur.space
Date: 2000-12-07 01:59:48 UTC
From: Rob Kling <rkling@home.com>
Message-ID: <oaCX5.136006$hD4.33608373@news1.rdc1.mi.home.com>
Source record: 7475

I think Rob is correct in that it should be easy to build a device capable of the same things as the DSP2232. It seems that he overlooked one very important thing "KISS". The computer industry is moving to appliance type devices not devices that need a full blown OS and special drivers to run. I like the stand-alone, dumb terminal interface of the DSP2232, this is what makes it a TNC. I have had my DSP2232 on DOS, Win 31, Win95, Win2000 and Linux. In fact it is the only device that has lasted through all the upgrades. It works very well, even with its old technology. I think he is correct in the fact that the DSP2232 needs a "Millennium Update", new modems, audio filtering etc but the basic concept should be maintained. Manufacturers need to make more devices that are stand-alone and that can be interfaced in a standard way. Serial is simple and fast enough for most needs, if not then USB certainly is. I think ICOM has the best approach, a bus that you can attach several devices to. Imagine you just get a new radio you attach it to your network of radio stuff and it is completely integrated. Your software knows about it and so do all the other devices. You could do this with a TNC, a rotor, GPS unit etc. That is a real step forward, whether it uses a Z80 processor means nothing. After many years programming computers I have realized that all bytes have 8 bits.

Rob Kling

Mainframe byte = UNIX byte = Fortan byte = C byte = Z80 byte = Intel byte....

3254. Antenna needed for EME??

Newsgroup: rec.radio.amateur.space
Date: 2000-12-08 18:53:25 UTC
From: Randy Mclean <rmclean@no_address.com>

Hello,
Next summer I am planing on setting up a Satellite station. I intend to use the m2 2MCP22(2m 22 element cross polarized yagi) and 436CP42UG(440mhz 42 element cross polarized yagi) with the yaesu G-5500 azimuth/elevation rotator. My question is, how well would this setup work for EME, if at all? I've been told that you need array of many antennas to work EME, is this true?? Thanks.

If you wish to reply via email please use my email address on Qrz.com as I do not use my true email address on Usenet for Spam reasons.

It was a realaudio file, but I don't recall the exact URL (I do remember is
was not listed on the "index" page of audio captures, because I went looking
for additional ones to try playing. It would be very embarassing if I've
been using something else entirely!

Those realaudio and mp3 files are meant to get the idea of the beacon
sound. I would be amazed when you could actually decode from such a file.
Realaudio and mp3 are lossy compression algorithms, that are likely to
discard phase changes first.

Try a wav file, that will work.

Depending on the frequency range in question a antenna gain in the
order of 20 db is considered normal for EME.

i would suggest stacking atleast 2 of each to improve gain and actually 4
would be ever better and you will need atleast 160 watts
there is a lot of signal loss between the earth and the moon and back and
you will also need a good preamp
good luck

Randy,

For 2m EME I would suggest a minimum antenna gain of 20 dBi, at least 1KW to the antenna and a noise figure of about 1 dB.

You can work some of the "big guns" (W5UN, KB8RQ, SM5FRH, F3VS, et.al) with less but that's about it. I have worked all of these guys using 1KW out, a HB 17 el, 3.2 wavelength Yagi, 180' of 1/2" Heliax and a 0.8 dB NF preamp (in the shack).

Before changing QTH, I had four of these Yagis and a short run of RG-17 and could hear my echoes about half of the time. I don't believe you are really EME capable until you can hear your own echoes.

Robert,

Good tip. You can get the same display by going to
http://www.monumental.com/rshorne/gram.html and getting the real time
FFT program here. You can set up frequency markers easily. Probably
works no better, but it is a much smaller dedicated freeware program.

First, I want to thank all the people for the replies. I do have a few more questions. You suggest "Stacking 2 of each". Do you mean stacking them in series or parallel to each other. Others replied that I need min of 20db gain, would "stacking" two add the gain of two antennas? Also to connect the two antenna to the same coax would i use a Y-connector??

Let me see if I understand if I "stack" 2 2MCP22 antennas each having 16db gain would that give me 32db gain??

Thanks Again?

When you stack another equivilant antenna you will get about 3db of
gain, better fb/fs and sharper pattern.

Stacking means one on top of the other. Then if you add two more you
put them beside the other two. Parallel feed.

Yeah, and if you really want to see a "stack" (of SHIT) you'll check
out Jeswald's horrible picture.

3265. AO-40 K-band telemetry?

Newsgroup: rec.radio.amateur.space
Date: 2000-12-09 01:01:39 UTC
From: Peter Delmotte <delmo@tele.kotnet.org>
Message-ID: <Pine.LNX.4.21.0012090140001.877-100000@popov.esat.kuleuven.ac.be>
Source record: 7399

Hi,

i just spoke to Danny, ON4AOD. He's the guy who built the
24 GHz transmitter on AO-40.
It seems that the 24 GHz transmitter was tested briefly.
Unfortunately, nobody seems to have paid attention to the
value of the K-band TX-power telemetry while the transmitter
was active. So if you have some old telemetry data, it would
be interesting to check if you can find a frame with the
K-band TX bit set. If so, we would be very interested in
the value of field #11A at the same time, because this would
tell us if the transmitter is really working.

greetings,

Peter Delmotte, ON4CDQ.

3266. bandpass transmitter question (FO-20 & FO-29)

Newsgroup: rec.radio.amateur.space
Date: 2000-12-09 01:28:42 UTC
From: meteu <meteu@bwi.net>
Message-ID: <90s2jchlg1@news.bewellnet.com>
Source record: 7400

How do I find a uplink and downlink freq. for FO-20 & 29? I think that if i hear a signal on the downlink i need to do a calculation to find the uplink freq but i don't know how.

I think AO-40 will be working the same way once it's opperational for general use.

thanks,

3268. Re: bandpass transmitter question (FO-20 & FO-29)

Newsgroup: rec.radio.amateur.space
Date: 2000-12-09 06:48:33 UTC
From: Bob Morehouse <nobobmorespam@pacifier.com>
Message-ID: <3A31D5C1.2F6D9DF5@pacifier.com>
Source record: 7402

The band plan for FO-20 and FO-29 is as follows:

The VHF uplink runs from 145.90 to 146.00
The UHF downlink is from 435.80 to 435.90
The center of the passbands should meet around 145.95/435.85

The transponder is linear and inverting; you transmit on LSB (or cw) and receive on USB (or cw), and when transmitting at the low end of the uplink, it comes down at the high end of the downlink.

So, if you are transmitting at 145.90, you will come down at approx. 435.90.

Here is an approx. scale you can go by:

downlink: 435.800 .810 .820 .830 .840 .850 .860 .870 .880
.890 435.900
| | | | | | | | |
| |
uplink: 146.000 .990 .980 .970 .960 .950 .940 .930 .920
.910 145.900

Remember to take into consideration the doppler effect, as your downlink will shift as the bird comes toward and then away from you.

Bob, KB7ADO

3269. Updated AO-40 Keps. Element set #5

Newsgroup: rec.radio.amateur.space
Date: 2000-12-09 23:06:56 UTC
From: vlfiscus@mcn.net
Message-ID: <t35eog9hue0c74@news.supernews.com>
Source record: 7403

Heres updated keps for AO-40. NORAD sets will still have problems until they can distinguish AO-40 from other launch objects. These are provided by Ken Ernandes, N2WWD.

Below is the current state vector and Keplerian element estimate for AMSAT OSCAR 40.

Vector format = 7
Satellite Name: AO-40 / OSCAR 40
Catalog Number: 26609 00072B
Epoch Date/Time: 343.50000000000
12/08/2000 12:00:00.000 UTC
ECI X: -11200.159135575 km
Y: -43794.661976426 km
Z: 1345.53214763604 km
Xdot: 1.57306794064000 km/s
Ydot: -0.0192097725400 km/s
Zdot: 0.15371053026000 km/s
ndot/2 (drag): 0.00000000690 rev/day^2
nddt/6: 0.00000E+00 rev/day^3
Bstar: 1.23081E-05 1/Earth Radii
Elset #: 5
Rev @ Epoch: 45.09033523945

The following Keplerian elements were computed from this vector:

AO-40 / OSCAR 40
1 26609U 00072B 00343.50000000 .00000001 00000-0 12308-4 0 54
2 26609 6.3783 240.2081 7347480 190.5533 201.9831 2.03015472 455

Satellite: AO-40 / OSCAR 40
Catalog number: 26609
Epoch time: 00343.50000000
Element set: 5
Inclination: 6.3783 deg
RA of node: 240.2081 deg
Eccentricity: 0.7347480
Arg of perigee: 190.5533 deg
Mean anomaly: 201.9831 deg
Mean motion: 2.03015472 rev/day
Decay rate: 6.90000e-09 rev/day^2
Epoch rev: 45

I'm looking for a simple method of switching between four polarizations
using a vertical and a horizontal feed. I think I've seen articles on
the subject
but can't imagine it being very simple with impedance and phasing lines.

thanks -Nick

I am sure that I read some where that while a shuttle or a operational Soyuz flight is docked, the 143.625 MHz channel is not used. Either the 130.167 MHz channel is used or the comms are linked through the Shuttle via the dock assembly.

Randy,

Stacking of antennas is not a trivial exercise. It is pretty much beyond the
scope of an Internet forum to educate you adequately on this subject.

You should acquire a good antenna book (e.g. ARRL Antenna Book) and do some
study. You can get some good answers to specific questions in these forums,
however, you can get an awful lot of misinformation too, as can be demonstrated
by some of the other answers to your query.

>
>Let me see if I understand if I "stack" 2 2MCP22 antennas each having 16db gain
>would that give me 32db gain??

Alas, it should be so. In theory, you can gain 3 dB by doubling the size of the
antenna ("stacking" two like antennas). In practice a better rule of thumb is
to figure on 2.5 dB.

Wes

Cry me a river. If you don't like what I post, don't read it, FOOL.

There are plenty of books via the ARRL on EME..in particular the ARRL
Antenna Book has a detailed chapter on that particular subject.

The decoder by Thomas Sailer also seems to work OK, but it doesn't seem to let you do anything with the data.

Hmmm

Someone recommends that a fellow should look for some answers in book, you poo-poo that idea as a sign of ignorance, I suggest that a book is a good idea and suddenly you're recommending I should read a book on EME?

I have actually *worked* EME, Bozo. Using, except for the coax, a completely homebrew station: antenna, rotor, tower, preamp, converter, tunable i-f receiver, exciter and 8877 final amplifier.

I also worked WAS on Oscar 6 and am one of fewer than 350 hams worldwide that has a QSL for two-way contact with W5LFL, the first ham in space, using the same homebrew equipment. Oh, and another thing, I got my Extra Class ticket by taking the exam in front of an FCC examiner, not from some of my W5YI buddies.

very good advise wes
he will also need a good mast mounted preamp and also understand that EME is ONLY CW
not voice
its not like working any of the satelites which most of them are easy and using
voice
i hope randy does a bit more reseach before he starts spending large amounts of
money on antennas

You're right, it is not very simple.

What you can do as a cost-effective and versatile solution: feed coax from both dipoles into the shack, and make sure they are exactly the same length. (when the dipoles are physically apart on the boom you may want to compensate for that in coax length, but remember the velocity factor)

Now you can connect a transceiver to either of these cables for linear polarisation. For circular, make an assembly which matches two antennas and provides the required 90 degrees phase shift (using sections of coax), and connect that to both cables. Swap the cables to reverse the polarisation sense.

You are a disgrace to the entire HAM Community. Suggesting that someone "Molested their kids" Is going too far, you degrade any viable comments you may have had in this childish behaviour.

I'm glad people like you are a minority in the HAM Community. Maybe you should stick to 10M with the Other CBers, you'd feel right at home there.

DUMBASS, the CB band is 11 meters, not 10. No wonder you couldn't EVER
pass a licence exam.

Congratulations indeed. Quite an accomplishment and the sign of a real
Amateur. You have to give Roger some slack. He did'nt understand what
EME meant. He thought it meant Eat Mothers Enema.

I considered this. ;-) However, after several unsuccessful attempts
I began to suspect there's something else involved.

3291. AO-40 and 2.4 antennas

Unlike Jeswald, who's made MEDIOCRE inroads in various contests.

Earth-Moon-Earth, FUCKHEAD. Care to show your goddamned ignorance some
more?

> He thought it meant Eat Mothers Enema.

Now, up to know I haven't brought this into our little flamewar, but
since you did:
So tell me, is eating your DEAD MOMMA'S ENEMA your idea of a evening
meal, REDNECK?
I could be like the Kawasaki guy and yell "dig her up," but remember
you opened the door for this.

3300. Anyone receiving tranmissions from STS?

Newsgroup: rec.radio.amateur.space
Date: 2000-12-11 03:59:24 UTC
From: Pervert_Extraordinaire <valued_customer1@att.com>
Message-ID: <3A347B4D.468E0970@att.com>
Source record: 7434

Is anyone successfully receiving transmissions
from the STS. I've been listening to the ISS
but, as yet, not the shuttle.

I understand the STS downlink frequencies are:
145.550 FM
145.840 FM

Should I expect to receive these signal on my
scanner. Are they typical FM, like the ISS?

TIA

>145.840 FM

There is no more ham radio on the shuttles. SAREX is now on the ISS
only.

"Tentative operating frequencies are: Worldwide downlink for voice and
packet, 145.80 MHz; worldwide packet uplink, 145.99 MHz; Region 1
(Europe) voice uplink: 145.20 MHz; Region 2 and 3 voice uplink, 144.49
MHz. Yet to be determined is the ARISS operating schedule, which will
depend on the crew's schedules.
The ARISS Team eventually anticipates multiband, multimode operations
with the crew and regularly scheduled school group contacts.
Once aboard the ISS, the crew is expected to be very busy with basic
housekeeping duties to prepare for their four-month-long mission,
Marchant explained. "The crew has expressed a high level of interest
in beginning Amateur Radio operations early in the mission," he said.
Crew members may use their personal call signs or one of the "club
station" call signs issued for ISS use--NA1SS, RZ3DZR, or DL0ISS. "

You should here them on a scanner with a decent antenna. Not much
activity yet however. The crew is really busy currently.

"Jeff Kelly" <jkelly@bellatlantic.net> wrote:

> Anyone know how much gain I will need in either
> a helix or dish to receive the 2.4 beacon?

People are reporting good results from AO-13 Mode S gear.
While the geometry is poor just after perigee, the short
range and higher beacon power compensate.

The 2m beacon says they're running the S2 beacon (2401.35 MHz)
from MA 16 to MA 30. I have a DEM downconverter (modified
per the Microwave Update '96 article) and a Drake 2880.
Now I just need to whomp up a new antenna...

3303. AO-40 visibility from 78deg North

Newsgroup: rec.radio.amateur.space
Date: 2000-12-11 23:28:43 UTC
From: Tom Rune Lauknes <tomrune@tss.no>
Message-ID: <913nvr$a6c$1@snipp.uninett.no>
Source record: 7437

Hello,

I have no access to a prediction program, and I am not to familiar with the
AO-40
orbit.

Can anyone please tell me whether I can see the AO-40 from my location at
78 13' 44.5" North
15 23' 44.6" East
el. 400m

I have access to a large S-band dish, and I am interested in trying to
capture the 2.4
downlink. Is the beacon on all the time ?

Thanks,
Tom R. Lauknes

3304. AO-40 element set #6 Post burn #1

Newsgroup: rec.radio.amateur.space
Date: 2000-12-12 00:07:38 UTC
From: vlfiscus@mcn.net
Message-ID: <t3ar2ab4co3lf6@news.supernews.com>
Source record: 7438

Below is the estimated post burn #1 Keplerian Elements for the AMSAT OSCAR 40 spacecraft. The burn ignition occurred at approximately 2000-DEC-11 1604 UTC. Note that these Keplerian elements represent the planned burn profile; the actual post-burn orbit may be somewhat different. Thus tracking reports with station WGS-84 lat/lon/alt and times of AOS/LOS versus *these* estimated Keps would be helpful.

AO-40
1 26609U 00072B 00346.67146000 .00000000 00000-0 00000-0 0 68
2 26609 6.4028 239.1973 7763693 192.2448 0.1497 1.57068165 527

Satellite: AO-40
Catalog number: 26609
Epoch time: 00346.67146000
Element set: 6
Inclination: 6.4028 deg
RA of node: 239.1973 deg
Eccentricity: 0.7763693
Arg of perigee: 192.2448 deg
Mean anomaly: 0.1497 deg
Mean motion: 1.57068165 rev/day
Decay rate: 0.00000e+00 rev/day^2
Epoch rev: 52
Checksum: 265

I communicated this information with NORAD/Space Command and spoke directly
with the Orbital Analyst responsible for computing the post-burn Keplerian elements. We will be exchanging pertinent information to facilitate publishing a high quality set of post-burn elements as soon as possible.

Try going to:

http://earthobservatory.nasa.gov/MissionControl/overpass.html

and using "Custom" for the "spacecraft" designation, input your location info,
then enter the "NORAD number" of AO-40, which is: 26609.

And there you are! "Instant" pass predictions.

>And there you are! "Instant" pass predictions.

... using very bad keplerian elements.

But that will hopefully get rectified in the future.

In general: the orbit is now over the equator. That means the pass times
decrease as you go further north. You will only see the satellite when it
is near apogee, which now sort of conflicts with mode-s usage as it is
switched on just after perigee (because of the spacecraft orientation).

When the inclination has been increased, situation will improve for you.
However, there may be a period when inclination has been increased and
apogee has not yet moved to the north (depending on how they sequence the
burns).

Are you sure, Cliff?
According to article S5 of the ITU Radio Regulations, the
Amateur Service has *secondary* status in the entire band
(in all three regions).

You are, of course, correct in stating that ISM equipment
(I guess that's 'part five' ?) has no protection, but we have
to accept interference from them (footnote S.150).

Greg,

The DSP-2232 works very well indeed at 9600 baud. If that is all you want, there are cheaper units from PacComm. It currently does not work faster than 9600 baud. Due to it being out of production, it would not be prudent to assume that will necessarily change, though of course it might. There is already an updated 400 baud TLM modem available for upload.

I got a chance to try live decoding on Sunday and had minor success. Seems
that the signal is much weaker - marginally acceptable with my handheld
yagi. No data decodes - all packets had bad CRCs. Did manage to pickup the
"announcement" texts with maybe 85% accuracy.

At first I tried recording on my minidisc player and playing back, but that
did not work either. Maybe only a true analog recording can be decoded???

All in all pretty neat, considering the xmitter was 40+ km away.

This is typical for omni antennas and the satellite near apogee.

>At first I tried recording on my minidisc player and playing back, but that

I never tried recording it, decoding live off-the-air signals only.
When you really want to record it, record a WAV file using your soundcard.
Check the specs for the demodulator first, probably it has to be 8000 Hz
mono. 8 or 16 bit.

>All in all pretty neat, considering the xmitter was 40+ km away.

Make that 40 Mm...

Don't forget AO-10 between monitoring sessions for AO-40 ;>)

The last few days I've worked:
ZR6JRN, DD9ZZ, 9Y4AT, N4ISS, K6YK, K0BLT, LW4DIR, DO1GL, F1RHS, DB2DX
plus a few more.
There is the usual deep QSB but generally very strong signals on the
peaks here in the UK.

You can get something very similar from here:

http://www.phillips-tech.com/main.asp?page=page7.asp

they also have some antennas that will work on Ao-40 but have linear polarization.

Please consider the people who try to monitor AO-40 with omni antennas,
and leave a few KHz around 145.898 MHz unoccupied.

Unfortunately the telemetry beacon is on that frequency, even though it
was announced to be on 145.880, so people using the "center of activity"
frequency on AO-10 are transmitting right on top of the beacon. They
probably don't notice it when using the required antennas for AO-10.

(of course it is too much to ask this from RS12/13 users, but those passes
are short)

3323. FYI" AMSAT-OSCAR 40 Status report

Newsgroup: rec.radio.amateur.space
Date: 2000-12-13 01:22:26 UTC
From: "3.14159265358979323846264338327 95" <rfspace@yahoo.com>
Message-ID: <mbAZ5.40233$4K4.6029508@typhoon.southeast.rr.com>
Source record: 7307

AMSAT-OSCAR 40 Status report
of December 13, 2000
Nearly four weeks have now passed since the launch, and there are some good things and some bad things to report.

As you all know, immediately after separation, we could not receive the 70 cm transmitter. Consequently we programmed IHU-2 to act as repeater and use the 2m middle beacon instead as our main downlink. In addition the two S-band transmitters have been operated occasionally, but the geometry within the orbit must be right to have the antennas point into the general direction of earth. This limits the use we can make of S-band.

The main activity so far for the command stations was to learn to fly the s/c and to prepare it for the first burn with the 400 N motor. This required a reorientation - the s/c must point opposite to the perigee orbital speed vector - and a spin-up to about 9 rpm. In view of this ongoing work, it was decided to postpone the analysis of the problem with the 70cm Tx to a time after the first burn.

The reorientation of the spacecraft turned out to be more time-consuming than initially assumed. We had two problems to solve:

1. As we get to our firing attitude, the geometry is very poor for producing direction changes of the spin-vector. The magnetic field of the earth is nearly perpendicular to the spin axis meaning that we can change rpm easily, but not direction. It turned out that rounding errors in the software of the IHU were in the same order of magnitude as the desired spin-change. Thus reliable control was not possible. But careful tweaking of the parameters used in the IHU finally enabled us to solve this problem.

2. The geometry is also poor in terms of attitude determination by our sensors with earth and sun viewed almost from the same direction. In fact for a certain time the earth sensor was blinded by the sun and delivered no useful data at all. But here the YACE camera in conjunction with the IHU-2 came in very handy. By taking pictures of the earth at strategic times we could use the YACE as another earth-sensor looking to the top of the s/c. It gave us badly needed additional data.

The IHU-2 played a vital role in processing and storing these pictures. Unfortunately the IHU-2 turned out not to be so reliable as the IHU-1; every one or two days it crashes. This results in the beacon transmitting only a weak carrier, but no modulation, until the IHU-2 is manually reset from the ground. So far this posed no real problem, but it is a nuisance. Also we have now some data of how the memory is corrupted by radiation.

Eventually we hope to install additional software in the IHU-2 which allows us to avoid or at least automatically recover from these crashes. But this has to wait until things get a bit quieter. Until this time we will have to live with the IHU-2 crashes, which seem to be caused by hard radiation and typically occur, when the s/c comes out of perigee and enters the radiation belts again.

Around Sunday Dec. 10 we had finally reached the proper orientation and spin for the first 400 N motor burn to take us to 50000 km apogee altitude. After reviewing the various constraints it was decided to execute this burn on Monday, Dec. 11 in the perigee of orbit 50/51. The necessary program was uploaded - this is an automatic sequence since the s/c is at this time at the equator with only 600 km altitude. Thus no command stations can be in contact with the satellite at the time of the burn.

So perigee 50/51 came and went - but the burn did not take place. The stored telemetry was analysed and it was found that the sequencer went through all the necessary steps, but no helium pressure was built up and consequently the burn did not take place. (It takes helium pressure to open the fuel-valves.)

On Monday Dec. 11 the situation was investigated and it was found that the pressurisation command was not resulting in any action. Initially the investigation concentrated on a software discrepancy, which existed between the software to test the system in Kourou and the one used in flight. But it was found that this probably was not the cause - the valve(s) simply refused to open. We had such a problem before during the test phase of the s/c, and one of the helium valves was repaired as a consequence. All the indications are that we ran again into this type of problem - which may be caused by the age of the components we are using. We then executed multiple open and close commands, which eventually got the helium flowing. But it was also noted that the helium flow was almost an order of magnitude less than required. Still we build up pressure in the tank to nominal and then programmed the s/c to perform the burn on Monday evening.

This time the burn started properly, but there were some anomalies in the telemetry indicating that the burn did not stop at the programmed time but lasted about 3 minutes longer. Thus we achieve an orbit with about 60,000 km apogee altitude. For our ultimate plans this is no problem, we would have used the electric propulsion anyway to further increase the apogee. James Miller had written a data collection program for IHU-2, thus we have a very detailed account of all the events of this burn. A detailed analysis is under way, but we have already some first indications of the nature of the problem and also possible ways to cure it or at least to cope with it, provided that the motor was not damaged by this event.

During the next days we will investigate this matter in detail. If we have a real problem with the 400 N propulsion system, we may need to change our strategy for achieving a useful final orbit. But it may also mean only that we have to observe a number of boundary conditions during the following burns and that the situation may have no impact on the mission goals.

For the next days no attitude changes are planned, thus we will be able to start to investigate the problem with the 70cm TX. During these tests we will find out if we can operationally plan on using the 70cm TX or not. So we are living exiting times.

Finally we would like to express our compliments and our appreciation to the command stations for the superb job they are doing. Each day they are facing new difficulties requiring a very large amount of time and dedication. They are doing a SUPER job.

I will be traveling from Denver to central wisconsin on the night of December 20th. While on the road I will be working as many satellites as i can. I am limited to the 2m/70cm FM birds however. I will be on I80 to Des Moines then north east towards La Crosse and then on towards Wausau WI. If there any grids along that route you may need let me know and I will do what i can for you.

I know AO-27 will be off air overnight. I have never heard SO-35 at night, is it off air then too? That leaves UO-14 for the overnights. Are the RS birds FM? if so, I need to know how to use them. I know they have bandpass transmitters and I don't know how to figure the uplink freqs.

Hi Guys,

Most of the MMDS converters that are sold on the internet are very easy to modify just like the Drake converters. They all work pretty much the same way. There are many vendors that will sell them in quantities of (1) like phillips-tech. The important thing is to buy one that is crystal controlled. All of the ones that I have seen use the same scheme.
They use a crystal in the 8.8 MHz range. This crystal is used as a reference frequency in the PLL. The PLL is basically a phase/frequency detector with a 2.278 GHz VCO. The frequency of the VCO (2.278) is divided by 256 with a Fujitsu MB506 (/256) prescaler and it is then compared to the 8.89 MHz signal from the crystal oscillator. The error voltage is low pass filtered and used to trim the VCO. They all have a low noise input at the 2.5 GHz side and some stages of amplification at the IF.

To change the LO frequency to say (2256) which gives you 2400-2256=144 the crystal is changed to 8.8125 which is 2256/256. This sets the LO frequency where it is needed. If the VCO does not want to go this low then a little bit of copper is added to the resonator traces so that it goes down. The only other modifications are to the IF circuitry to make sure that it passed 144 MHz and the input circuitry to optimize the gain and noise figure.

I have added some links to some pictures on my site below. They show the insides of the california amplifier converter that is built-in to the parabolic antennas. All of this circuitry is between the reflector and the feed.

FYI, Phillips-Tech has the best price I have found over hours of searching the Web for the "BBQ grill" style antennas. These are essentially the ones that R. Meyers used to sell. Get the 24dBi model and with the 3dB polarization loss you'll still get 21dB which seems to be more than the pre-launch estimates were calling for. I think I'm still going to hold off for a bit yet and see what results other braver and/or richer persons have with the S band downlink. Besides, it's too cold now in New England to do antenna work.

3331. What IF to use with Drake?

Newsgroup: rec.radio.amateur.space
Date: 2000-12-14 06:39:19 UTC
From: "Greg D." <gregd@jps.net>
Message-ID: <3A386B17.9E403D9@jps.net>
Source record: 7315

Well, AO-40's up, so it's about time I got my Drake 2880 modifications in gear...

As I see it, I have 3 choices for the IF, given the equipment that I have:

1) Do the IF bandwidth mod and change the crystal to put the 2.4 ghz donwlink into the 2 meter ham band. Use my Yaesu 736R for the IF receiver, tracking doppler by computer (Fodtrack).

2) Do a crystal change and possibly tweek the LO to put the 2.4 ghz downlink into the 70cm ham band. Leave the IF bandpass coils and such alone. Use the same Yaesu 736R for the IF receiver, and doppler tracking by computer.

3) Do only a crystal change to put the LO at 2.000 ghz (with an IF at 400.0 mhz) and use my ICOM R-7000 allmode scanner for the IF receiver. Doppler tracking is manual (Fodtrack can't talk to the ICOM). This option makes mental frequency conversion easy.

I'm not experienced with microwave stuff, but somehow I expect that the Drake will perform better if I leave the IF strip alone. It's also less invasive. I also heard that once the satellite's orbit is finalized, manual doppler tracking will be relatively easy. I am used to manual tracking on the LEO birds when running SSB, even though Fodtrack can theoretically do it for me. All this would tend to favor option #3.

The one unknown that I see is what uplink bands will be used with the 2.4 gig downlink. I know that 1.2 has been discussed a lot, but what about the use of 2m or 70cm? If 2m is used as an uplink, I can't do option #1; similarly, if 70cm becomes an uplink, options 2 and 3 are out (#3 because of how close the frequencies are).

Does anyone know enough about the band combinations to advise?

Thanks & 73s,

Greg.

Maybe, maybe not. From http://www.amsat.org/amsat/news/ans.html

"Early Wednesday, December 13th, telemetry transmissions from AO-40
stopped while work on the 400 N propulsion system was in progress. An
investigation by the AO-40 development team has begun. They are now
waiting for certain on-board software events to occur on Saturday
afternoon, December 16th. These are programmed to start a spacecraft
emergency routine called 'command-assist' which attempts to re-establish
communications. This offers the best chance of recovering evidence of
the incident which made the telemetry transmissions stop."

A little premature. According to the bulletin from AMSAT there's an emergency routine that will kick of on Saturday afternoon that may help to re-establish communications. I'll be holding my breath until then.

The report about telemetry stopping - does this imply that all repeater function is also dead?

Not knowing how the thing was put together, I'd assume that from what has been reported so far, there is reason to hope that if Saturday proves fruitless, that the other bands/modes may work . Unless there is a single control/telemetry system that may make it impossible to active the others???

Anyone with more insight?

Jeff Kelly <jkelly@bellatlantic.net> wrote:
>What is the current thinking - the engine exploded?

I think it is not that dramatic. I looked at the telemetry as it was last transmitted, and it can be seen that someone was commanding the spacecraft in the last 10 minutes. A few commands were successfully executed (returning a page of result data), and then a command returned an error message "Invalid Name".

Shortly afterwards, the satellite sends pages with a repeated pattern of data that is not normally observed.

My speculation is that something went wrong with a command. My understanding is that commands really are program fragments in IPS, a German programming language strongly resembling the Forth language. This is a stack-oriented language.
Sometimes pages with program fragments are sent down, the last one seen was:
.5050 #DE32 #70A2 PN31F 3 !FK : WAIT10 10 SEK0 ANFANG SU0 @B
ENDE? ; 1 VAR BLOX : MANY_ARMS PWR-ON WAIT10 0 EPOS #200 LuERZ
0 480 JE PM31F $EBU I + 6 >>> 32 +NUN 0 BLOX 1 - JE TZ-WARTEN
ETRANSMIT NUN WAIT10 PWR-OFF ;

Maybe something went wrong executing such a program fragment, and a stack overflow or other problem overwriting the memory resulted. This may have left the IHU in a state where it still does trigger the short-term watchdog (assuming that does exist), but is not longer operable for sending telemetry or obeying commands.

Therefore the command station has to wait until a longer term watchdog fires, which happens when no valid command has been received for a couple of days. That should get the IHU to be reset and listening again.

When it really was an explosion or other drastic event, I would have expected a more sudden end of the transmissions than observed in the telemetry.

But of course, we don't really know for sure until it comes back on the air!

Rob

However, the sinister part of the report was:

"Early Wednesday, December 13th, telemetry transmissions from AO-40
stopped _while_work_on_the_400_N_propulsion_system_ was in progress. "

The contact was lost to several satellites and a few Russian and
American Mars probes while pressurising the fuel system or executing
a rocket burn. Usually a large number of fragment have been observed
in the predicted orbit. In other situations, the fuel has leaked out
when there was a control function failure while setting up the
propulsion system for a burn.

Lets hope that AO-40 is still in a single piece and that it will
recover from "safe" mode by Saturday.

Is there any chance that NORAD can tell us if the satellite is still in one piece, or even still there? If there's a chance that it has blown up or changed orbit due to a leak in the helium tanks, etc, you'd figure they'd want to know.

David Reinhart, WA6ILT

The positive thing, as far as I see it, is that it has transmitted
garbage for quite some time before the transmission finally stopped.
That is not very consistent with an "explosion" type of event.

(the last A block is timestamped 11:17:06 and the controllers report
failure at 11:23. there are 22 garbage blocks plus an incomplete block
after this last A block, indeed indicating an elapsed time of about
5 minutes)

Hi Rob,

Thanks for the informative posts. I agree it is way too early to jump on
the "all is lost" bandwagon considering that AMSAT and others have
eventually recovered satellites that fell silent in the past. I'm
wondering if anyone has a better time estimate than "Saturday afternoon".
I'd like to be listening at the appointed time, but if not I'll just keep
checking throughout the day.

Thanks again,
Lee-KU4OS

3357. Best AO-40 Element Set

Newsgroup: rec.radio.amateur.space
Date: 2000-12-16 01:08:07 UTC
From: Lee <devnull@cfl.rr.com>
Message-ID: <Xfz_5.137499$vc3.27434447@typhoon.tampabay.rr.com>
Source record: 7341

I'm wondering which is the best element set to use for AO-40? The epoch of the set in the latest AMSAT bulletin is Dec 11 which would be before the burn on the 13th. On the other hand it seems closer to the post burn 1 nominal than last weeks element set.

Is there a TLE that includes the actual burn from the 13th and where can I get it?

Thanks,
Lee-KU4OS

From: bhyde <bhyde@vvm.com>
Message-ID: <3A3AE031.22593718@vvm.com>
Source record: 7343

I just received a 436 cp30 in the mail to replace my worn out 435 18C.
On the 435 18C there is a relay on the antenna to switch between right
hand and left hand circular polarization. On the new 436 CP30 I noticed
that I must build it either as a right hand or left hand polarized
antenna, no switching available.
Do I need to build it for Right hand or Left hand to get into AO-10 and
hopefully AO-40?

There have been some encouraging reports of a weak signal on about the correct frequency at about the correct place in orbit. I will put money on AO-40 being located in the next couple of days and a recovery shortly thereafter. The guys running the program are in fact "rocket scientists"!

I think we all need to stop panicking and do something positive like listening out for the signal and writing some checks to AMSAT to get the accounts in the black.

Hi guys,

Does anyone know what the exact center frequency of the telemetry was? Is this where the weak carrier is being heard. I have read reports of a weak carrier, but can anyone confirm this. It should not be hard with directional antennas. I am looking at a spectrograph right now and all I see are carriers that donot seem to be changing with doppler. I'll keep looking. Does anyone know the exact GMT of the reboot?

I think AO40's motor uses the same hypergolic fuels as was on the NASA Mars Orbiter that exploded several years ago while the helium tanks were pressurizing up the motor for orbital insertion burn. However, I didn't think that hydrazine and nitrogen-tetroxide exploded that easily. I thought they merely ignited if mixed outside a combustion chamber. So, I guess we wait, and hope.

Confirmed, about S1 here. I only note about 6 dB difference in polarity switch.

> 435.517.6 - Solid carrier. Stronger than the 2m signal (but I have a preamp
> on the mast).

Confirmed, but weaker than the 2 m signal here--about 3 dB above the noise.

> 435.609.5 - Modulated carrier. Sounds like PSK somewhat to me. Has the
> same characteristics in terms of antenna movement of the above 2.

Confirmed at 436.613. Dissapears on polarity switch.

> 435.862 - Solid carrier. Also same as above with the pointing.

Not heard here.

On 16 December at 1817Z I'm hearing an unmodulated carrier zero beat at 145.897.2. It has been Dopplering down since I started monitoring it at 1628. Initial frequency was 145.897.5.

I can't get a really good null on it with my antenna. The Cushcraft has too sloppy a pattern. If I don't hear any activity (i.e., the beacon telemetry coming back on) I'll monitor it around the predicted LOS time for AO-40 to see if it goes away.

3371. I can't confirm the 70cm observations

Newsgroup: rec.radio.amateur.space
Date: 2000-12-16 19:03:30 UTC
From: David Reinhart <wa6ilt@bellatlantic.net>
Message-ID: <3A3BBC83.EC5FF61@bellatlantic.net>
Source record: 7355

Nothing at all on 70cm. Should there be? After all the command team couldn't copy the 70cm beacon after launch which is why they switched it to 2m.

I'm still getting that carrier with Doppler shift, now zero-beat at 145.897.1. The rate of change is slowing which makes sense since the bird would now be getting close to apogee. This is at 19:01Z in FN42dm.

Colin > > Thanks Colin, > > BTW, whats the S-Band? > S-Band is what the shuttle uses to transmit voice and telemetry to earth via the TDRS tracking system. It's up in 2000-2500mhz band (I can't rememder exact freqs. but if you search around the shuttle web you'll find them.) There is an S-Band antenna in the Z1 truss on ISS and that's what they'll start transmitting through come January - I believe they have already done some tests with it which worked out fine. So maybe this form of comms. will take over in the main from vhf - I can't receive freqs. in the S-Band - in fact I don't think anybody can because they are digital and more or less encrypted. You'll have to rely on NASA tv I expect for all your comms. if it does take over completeley - we don't get that over here. Hope this helps. Colin

Source record: 7359

Ok, so what am I hearing right now (12/14/00 20:00 UTC)? I'm aimed
due south from CM98kx at the horizon. At 145.900 there's what looks
like an unmodulated PSK signal, but the frequency spread seems
a bit too wide (wider than the two lines on the IZ8BLY decoder).
Also AO-40 should be up at around 45 degrees elevation, by the
orbit 52 keps.

Could be terrestrial, I suppose...

Greg.

3376. 145.897 signal now Dopplering up

Newsgroup: rec.radio.amateur.space
Date: 2000-12-16 20:16:00 UTC
From: David Reinhart <wa6ilt@bellatlantic.net>
Message-ID: <3A3BCD78.46AE505B@bellatlantic.net>
Source record: 7360

This signal went as low as 145.897.1 and started Dopplering up. It's now
zero-beat back at 145897.2. The change was first noticed about 1805Z in FN42dm.

That behavior doesn't make much sense to me if what I'm hearing is AO-40. The
should still be about 20,000km from apogee.

David Reinhart wrote:

!!!CLASS ACTION!!!

If you pay them, they have to provide a minimum set of services. They probably use some sort of user agreement to put you off but those may not stand up if they are really that bad. Talk with some other people that have the service and if they concur then get a lawyer. If it is just you then complain loudly and often.

Just because they're going to be going to S-band for mission communications
doesn't mean that they're going to stop ham activity. In fact, sometime next
year they're supposed to set up an SSTV station, so you'll be able to hook up
your scanner output to your sound card and receive pictures.

I have yet to hear the ISS. I have been told they have been on ao-27 and was wondering if anyone else has heard them?

Part of the problem is I may have messed up my conversion from UTC to local time. ARRL said that their work day starts at 0800UTC which I figured is 1am Denver time, they have lunch at 1200UTC (5am local time) and end of the day at 1900UTC (noon local time). did I get iy right?

if so, I have yet to see any passes in my area during that time. The passes here are all in the late afternoon and evening. that is after they are, i assume, in bed.

am i on the mark or waaay off base?

thanks,
Carl

Hmm no I don't think so. As best I can determine, the ARRL's time zone
is -0500, which means they are 5 hours behind UTC, and you are in
-0700, which means you are 7 hours behind UTC. So they are 2 hours
ahead of you.

If the ARRL start at 0800Z, that's 3am local (unlikely). More likely
it is 8am local, or 1300Z, or 6am your time.

I fixed that by installing two "XML libraries" packages from my SuSE CDs.
They are:

libxml-1.7.3-3
libxmld-1.7.3-3

Source record: 7374

'Apparently' there is no exact time of the reboot. From what I've been hearing there is some sort of watchdog, that no one will fess up to when it should kick in.

Information is very sketchy at best.

Rely on official sources only....since is plenty of false info, and false reporting going on.

From what I gather, when this 'reboot' does occur it will go through the same scenario as when it was launched, meaning it will begin to broadcast on the UHF system, which (if you remember) wasn't working properly. So.....the command teams need to get it switched over to VHF on it's beacon manual. From what I've been able to descern from folks like KB0G (I think) and W3IWI, and G3WRL there is no automatic switching of the beacon. Everything is manual with regard to band switching, even if there is high SWR. (DOH!).

So....if folks are trying to hear it they should be listening on UHF. The best I can get form folks on the IRC chat is that it's supposed to come up on the 436.450Mhz Beacon after a reboot. But I've heard reports that people hear it on 436.609 Mhz. Which I highly suspect is NOT AO40.

I'm no perfect source of information. Just sharing what I've been able to get form some sources I trust.

Sure wish AMSAT would find a way to provide us with an FAQ on this sort of stuff....relying on rumor to track a wayward sat. seems kinda lame.

3391. NMHT 's for 23 and or 13 cm

Newsgroup: rec.radio.amateur.space
Date: 2000-12-17 14:07:22 UTC
From: rheticus <ed@doofpot.nl>
Message-ID: <NG3%5.37188$fy2.2393292@news.soneraplaza.nl>
Source record: 7375

While surfing the net, my eye was caught by
the drake 2880 story, but that is not available
(easy) now a days.

Now for my question :

In the netherlands there is a very vivid community
of ATV hams.
They use quite some stuff (fi chapparal) to convert
signals from 23 and 13 cm to get their pictures in.

This is quite broad. We as space-people are not
that wide banded, but I see not much information
on the usage of these converters for sat-purposes.

I don't mind building converters, but if there are
converters for just a few dollars (ex. Fl 165 / $ 70)
to convert 13 cm to somewhere usefull (2 or 70)
for receiving purposes, one is half way a full trx
combination for the leo's and other sats ....

?
Anyone has more idea's or information or are we
on the edge of some low-cost conversion projects
here :)
?

73's de PE5ED
eagerly awaiting the revival of AO-40 or just
in preparation of Phase IV A :-)

Whatever the signal described below is, I doubt seriously it's AO-40. It continued well beyond the predicted LOS of AO-40 for my QTH (FN42dm). The orbit would have to be so radically different that I doubt I'd be pointing in the right direction.

David Reinhart wrote:

> This signal went as low as 145.897.1 and started Dopplering up. It's now

I'm unsure what you mean by 'on AO-27'. Are you implying they are
repeating of this satellite or something? I've ONLY heard them
'on the ISS' on 143.625. Perhaps I'm missing something here...

> if so, I have yet to see any passes in my area during that time. The passes
> here are all in the late afternoon and evening. that is after they are, i
> assume, in bed.

I've listened to the ISS perhaps 20 times. They've all been in the day/evening
timeframe. Given I live in IN and you in CO, I'd think these are comparable?

Note (I was told) they were not using the 143.625 frequency while the
shuttle was up. They were to return to this frequency after the shuttle
landed. I, for awhile, was unable to hear them... till last night.
They're back!

Hi Carl:
The ISS crew is incredibly busy. While ham radio is important to them, it has to have a much lower priority than keeping the air breathable! We all need to be patient while the first crew gets the station into a stable situation. We are working very closely with the following expedition crews to maximize the chances that they will be able to do random QSOs.

The school contact on Tuesday will use the public 145.80 downlink, so some people will get a chance to listen in to that. As soon as I get more information about the possibility of general operations I'll get it out...
73,
Will

I have been watching a signal for about 10 minuites now. It started out at
436.450.10 and is now at 436.49.47. I currently have AO-40 moving away from
me(according to my tracking software and the latest keps from AMSAT).
Does anybody else hear this signal? The doppler shift is very slow.

Ted

Sort of. SSTV sends individual pictures rather than a continuous strip. If you
have a shortwave-capable rig, there's a lot of SSTV activity in the
14.230-14.233 area, upper sideband, that you can use to check out your software.
Be aware that SSTV comes in a *lot* of different modes. If the ISS station is
similar to Mir, they'll be using Robot36, I think, which is fairly new and not
widely supported yet.

I take it the "SS" in "SSTV" stands for Single Sideband. My RS 2006 scanner
lacks SSB capability. I've seen a modification to enable SSB reception tho'.

This is a bit out of my league for the present...

Thanks again.

Can anyone using an ICOM 706 Mk II tell me how to use the split frequency function to work mode A or mode K satellites? I would like to be able to adjust the receive frequency and have the transmit frequency adjust proportionally without switching between VFO A/B to change it manually. Is this possible? The owner's manual implies it but I cant figure it out.

Pete

HI

Your scaner should be OK. The Slow Scan TV from MIR was un 2m FM
the ISS will be the same. If you had access to SSB gear you could test the hardware
ahead of time.

Take a look at http://www.siliconpixels.com/

3413. AO40 and Lower Tech Sats

Newsgroup: rec.radio.amateur.space
Date: 2000-12-18 12:37:55 UTC
From: "J. Duffy Beischel" <duffyb01@fuse.net>

Source record: 7397

Looks like we may have put all our eggs into one basket and the basket may be gone. I cannot understand why AMSAT will not build cheaper sats that can be more easily used by a majority of hams (2 up and 10 down). Sats that use all these SHF frequencies are just not in reach of Joe six pack ham. They take too long to build and when they fail, it is a major disaster for the ham community. I'm not saying AO40 is dead yet, I have no idea. But the possibility brings about the question of why not more and simplier sats for everyone.

There already are *many* simple and cheap satellites. How do you think the
numbering got up to 40? And then I am not even mentioning the RS series.

Why not try to make a somewhat more complicated satellite once in a while?
Do you think only appliance operators should be using satellites and there
should be nothing for those who want to experiment, e.g. at SHF frequencies?

And why don't you consider that other amateurs may not like the use of
low frequencies because they have a lot of QRM or have no place to put up
the large antennas needed at those frequencies?
Don't you think they should be allowed to use a satellite using only a
couple of small helices?

It looks like you are only taking your own situation (apparently owning a
HF and 2M transceiver) into account, and conclude that must be the
reference for "the majority of hams". Don't forget that there are many
hams that have no HF license and hence no reason to buy equipment for HF.
For them, a 10m downlink is just as complicated as a 13cm downlink is for
you: they have to build or buy a converter and antenna.

You can't have your money back. If I were you I'd buy a Phase 3D model while
they're still available, that way you'll remember where your money went.

Me, I think 'size of antenna' is a better indicator of how difficult the satellite will be to use. That is if there are enough people on a band, the equipment will be there. But, putting up lots of aluminum on the roof -- that's a pain. I imagine maybe a little dish, with two feeds on it.

Either that or maybe go low orbit digital with high power, sort of like the DO17 concept. Where maybe we all walk around with little pagers that can receive messages -- or something like this. Just a random thought.

LEO satellites have a small range and a short communications interval.
That is why they are usually fitted with store-and-forward digital systems.

Using a LEO sat with a transponder means you will be limited to 3000 km
QSOs with only a short exchange of information. Not everybody likes that
contest-style operating.

A satellite in an orbit like AO-40 will allow you to talk cross-continent
for extended periods of time.

Your preference for HF uplinks ignores the fact that until the CODE wars
have finally been fought out, not everyone has a license to operate on HF.
Those with a no-code license often are interested in using satellites.

3420. AO-40 keplerian element Set #11

Newsgroup: rec.radio.amateur.space
Date: 2000-12-19 00:18:01 UTC
From: vlfiscus@mcn.net
Message-ID: <t3ta9ps2gfl612@news.supernews.com>
Source record: 7256
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

AMSAT-NA's N2WWD provided ANS the following preliminary Keplerian elements based on a single radar pass. More accurate orbital elements should follow from NORAD in the near future -- following a second radar pass that should provide time and geometric distribution of the tracking data.

AO-40
1 26609U 00072B 00352.42798611 .00000000 00000-0 00000-0 0 115
2 26609 6.3033 237.3129 8126708 194.7923 102.4478 1.27093349 581

Satellite: AO-40
Catalog number: 26609
Epoch time: 00352.42798611
Element set: 11
Inclination: 6.3033 deg
RA of node: 237.3129 deg
Eccentricity: 0.8126708
Arg of perigee: 194.7923 deg
Mean anomaly: 102.4478 deg
Mean motion: 1.27093349 rev/day
Decay rate: 0.00000e+00 rev/day^2
Epoch rev: 58
Checksum: 266

Stay tuned to ANS for additional bulletins from AMSAT, the official source for information on AMSAT OSCAR-40.

[ANS thanks AMSAT-NA and AMSAT-DL for this information]

Is
> this possible? The owner's manual implies it but I cant figure it out.
>
>Pete

Pete, the mode you suggest (auto tracking between A and B VFO's on
different
frequencies) is not implemented in the 706. For a start of course the 706
is
not a duplex radio (you cannot transmit and recieve at the same time). It
is
only duplex radios (designed for satellite use) that normally include
"satellite mode" VFO tracking.

However, I think it might be possible for an external microcontroller (like
the PIC family) to be programmed to do what you suggest via the Icom CIV
interface. It would recieve freq/mode info from (say) VFO A each time the
frequency was adjusted and then quickly change VFO B by a specific offset
(to suit the particular satellite). Someone with PIC experience (and CIV
knowledge) could probably do this quite easily (count me out, I am not a
programmer!).

Of course if you use TWO Icom radios then what you describe is much easier.
Icom have the CT16 satellite interface which does just this and in addition
there are some software packages around which do similar things. With two
radios you have full duplex also, enabling you to hear your own signal on
the downlink and properly zero beat another station.

JDB makes some valid points.

Whilst there have been many satellites launched, the number with linear translators is much smaller. In fact linear birds appeal to a wider audience (than pacsats) and will also support many of the exciting new narrrow band digital modes such as PSK, MFSK, HELL, etc

If AO-40 is lost (don;t write it off just yet though) then a family of much simpler linear translator birds might be the way to go - drawing on the legacy of the RS and FO designs.

I don't agree about mode A though, if one is to use HF then it is much better to use HF for the uplink (21 or 24) and 144 for the downlink. Plus maybe U/V (or V/U) or U/S for more advanced users?

As for orbits, some thing like that of RS-15 would keep many of us happy..

No, just detected it with NORAD radar. They say it is in one piece - this
puts the disintegration theory to rest.

Next step is to wait to Dec 21st and Dec 25th for possible automatic
reactivation. After that they consider using the rest command (but they dont
want to be hurried into trying that till they have given the on-board

time-outs a chance to work.

Chris Muir ZL1BOE

3426. AO-40 Update

Newsgroup: rec.radio.amateur.space
Date: 2000-12-19 07:29:40 UTC
From: George Hiscox <ghiscox@earthlink.net>
Message-ID: <sf3u3tkfh3gt8fpk084nog7h0nh58cvuag@4ax.com>
Source record: 7260

ZCZC AS26
QST de W1AW
Space Bulletin 026 ARLS026
From ARRL Headquarters
Newington, CT December 19, 2000
To all radio amateurs

SB SPACE ARL ARLS026
ARLS026 AO-40 still silent

AMSAT OSCAR-40 remains silent, and command stations on the ground still have been unable to reestablish contact with the Amateur Radio satellite. It had been hoped that an onboard computer timeout expected on or about December 16 would restart the beacon telemetry and give the ground crew some clues as to why AO-40 suddenly stopped transmitting on December 13.

AMSAT-Germany's Peter Guelzow, DB2OS, of the AO-40 team, said nothing was heard over the weekend, and command stations tried to re-establish communication by sending blind commands. If the reset had occurred, the satellite would have been restored to its post-launch configuration and attempt to transmit on 70 cm. However, the 70-cm transmitter has been problematic, and the satellite likely still would need to be reconfigured for 2-meter transmission at that point to be heard on Earth.

The AO-40 team is continuing to investigate reports of weak signals on the 2-meter downlink frequency of 145.898 MHz that seem to be coming from AO-40, but it has discounted reports of telemetry heard there as a hoax. Other reports persist of a weak, unmodulated carrier, however.

Guelzow said today that the AO-40 team is encouraged by a report from the North American Air Defense Command--NORAD. The report indicates that AO-40 was found to be in one piece, that the orbit was exactly were it should be, that the radar cross-section was as expected, and that no other pieces were found. Guelzow said the NORAD data counter rumors ''which no one on the inner team believed'' that AO-40 might have exploded.

AMSAT-NA President Robin Haighton said ground controllers were exploring several options.

When and whether the satellite will be heard from again depends, in part, on whether AO-40 has picked up any of the ''blind commands'' sent by ground controllers. Guelzow says that if no commands were

accepted by the IHU-1 onboard computer since contact was lost December 13, then a ''command-assist'' watchdog routine on December 21 will cycle the satellite through various receive, transmit, high-gain and low-gain antenna modes. If AO-40 did pick up some commands, Guelzow said, the command-assist watchdog will be reset for another 10 orbits. That could extend the wait until sometime after Christmas.

Guelzow says the ''watchdogs'' are software resets. Ground controllers want to avoid doing a hard re-boot of the main computer, which is considered a last resort. ''There is no need to hurry, and the command team doesn't want to miss any option,'' he said.
NNNN

And here are the latest keps from NORAD:

AO-40
1 26609U 00072B 00352.42798611 .00000000 00000-0 00000-0 0 115
2 26609 6.3033 237.3129 8126708 194.7923 102.4478 1.27093349 581

3427. AO40 - Outgassing ?

Newsgroup: rec.radio.amateur.space
Date: 2000-12-19 08:53:27 UTC
From: Mike <m.j.willis@rl.ac.uk>
Message-ID: <91n7m9$ena@newton.cc.rl.ac.uk>
Source record: 7261

It worries me that the AO40 transmitter was running so early after launch. Low pressure gas might have caused some problems with the transmitter output stages arcing. I know the satellite went through thermal vacuum testing, but then it sat waiting for launch for a long time. The lack of telemetry might be a result of the transmitter failing, or hopefully just going into a safe mode. Probably the best thing to do is to wait and send a reset after a couple of weeks if nothing happens.

If the failure is a transmitter problem, perhaps someone with an EME array could look for a very weak signal on 2m and 70cm ?

Mike

PSK31 and MFSK are quite difficult to operate through linear
satellites because of the doppler shift. Hellschreiber is more
forgiving of tuning errors; MFSK is not at all forgiving
(< ~5 Hz is enough to upset it).

It was kept off for 3 hours after launch. I cannot judge if that was long
enough, but I would guess that the appropriate experts were consulted when
determining this time (which was stated to be for purposes of releasing any
gasses from the satellite).

>be a result of the transmitter failing, or hopefully just going into a safe
>mode. Probably the best thing to do is to wait and send a reset after a
>couple of weeks if nothing happens.

>If the failure is a transmitter problem, perhaps someone with an EME array
>could look for a very weak signal on 2m and 70cm ?

The failure did not look like a transmitter problem in the telemetry.
It much more looks like a crashed computer. A command was sent, an error
message returned, 5 minutes of strange data was transmitted, and only then
it stopped. Unless the strange data was the expected response on the last
command (the command stations do not provide the general public with
information like that, so we can only guess), it very much looks like
a piece of software running out of control and overwriting memory areas.

What I find most disturbing (and seems to be so easy to rectify) is that
there are these long periods of no information at all, and then those
information bulletins that definately tell what will be done or what will
happen and when. When the time of those events goes by, nothing is heard
for several days and then there is another statement that sometimes sort of
contradicts what was said before. E.g. on 13-12 there was a statement
by the project leader that they were waiting for the command-assist routine
to become active on 16-12 afternoon (it did not mention a timezone...).
When nothing happened, it took 2 more days for a message to be spread
that really the event expected on 16-12 was something else, and
command-assist would not activate before 21-12 and maybe even not before
25-12. In the meantime, it was during a weekend, of course everyone
was anxiously waiting for the telemetry signals to be heard on any of
the beacon frequencies, as the command-assist routine was supposed to do.

No wonder that speculation about the fate of AO-40 is going around, and
that so many doom-scenarios are being thought out. It would only be a
matter of politeness towards all the anxious observers to inform them
about an error in the published information as soon as possibe.
All the mechanisms for quick information distribution are in place

nowadays. When they aren't used to distribute factual information,
of course speculation gets distributed instead, and just as quickly.

Perhaps the best would be if all design data (schematics, drawings,
descriptive text, software as far as it is not related to secure command
uplink) would be made available publicly, as suggested elsewhere.
That way outside groups who really want to investigate what might be
going on can do so without bothering the commissioning team, and they
even might find the problem in the process. At least there would no
longer be a reason for so much guessing.

No, it's not insured. I don't think any amateur satellite ever has been. The cost of launch insurance is so high that it equals a substatinal portion (50% or more) of the material value of the satellite that it isn't economically feasible or viable. I don't think anybody writes insurance on satellite operational losses, anyway; only on launches and this problem can hardly be considered a launch event.

Well for my 2 cents....

I had tons of fun with RS-10/11 and later RS-12/13. I would like
to see another Mode A bird - I haven't heard RS-15 in quite awhile,
and when it was on, it was very, very weak. However I don't think
(correct me if I'm wrong) that Mode A is part of AO-40...

While there are many LEO birds, those are digital ones or FM. Don't have
the digital equipment, nor the antenna to make the FM birds work for me.
Hence my desire for a Mode A linear translator.

Guess we'll wait for AO-40....or it's obituary

My feeling is that anyone who has ever gotten any satisfaction from RS10/11 would be absolutely ecstatic about operating a Satellitle like AO-13 during it's best days. I've been licensed for 42 years and I look upon that experience as one of the most rewarding. It provided ecxiting DX opportunities along with predictable scheduling for for ragchews between amateurs in almost every corner of the world. How about some simple AO-13 style birds with enough redundency to provide long term fun using 2m through 2.4GHz?

Hi Guys,

Can anyone explain how a hard reset would be triggered. I know this is not information that you want people to know, but is it some sort of really basic receiver that looks for a tone or something similar. It would have to be pretty independent of the main computer so that it is not afected by it's crashes.

Pieter

AO-10 was insured, wasn't it? That was the first P3 satellite after the
P3A disaster, and there was a launch insurance fund to collect donations to
pay for this insurance.

If I remember well, it even (partly?) payed out because of the collision
with the launch vehicle and not reaching the planned orbit.

Normally this is done by sending a reasonably long code (a sequence of bits
on the command channel, for example). It is not decoded by the computer
but by hardware, e.g. a feedback shift register, or a state machine built
from a PROM.

Hi,

With all this AO40 stuff going on . We have forgoton about the space station.

I heard the SPACE STATION "NA1SS" CALLING on 145.800 FM this afternoon in New Jersey at
20:59 Z. But I guess the School station they were calling never came back to them.

I have a sample of the signal as an MP3 file.
The file is 456K so it's to big to post here.

Maybe I'll put up at my FTP site.

73

I also really enjoyed them quite a lot. I had a simple station. An old
Icom 2 meter all mode and crossed diple antenna I built myself and a
Uniden HR-2600 also with a home built crossed dipole. It was a real
kick to work stations as the satellites passed overhead with no worry
about rotors or tracking the pass or any of that, simply adjusting the
2 meter VFO during the pass to keep the 10 meter downlink frequency the
same all the time. I don't understand why the no code tech operators
have a problem with the 10 meter downlink frequency. All your doing is
receiving there and so you would not need to upgrade to operate these
types of satellites. After all, it's not your fault that the satellite
is taking your 2 meter signal and retransmitting it on the 10 meter
band! Maby the big problem is all the money that was spent on equipment
for use with AO40 that might now never be used IF AO40 does not come
back as it could be years before another satellite like AO40 is built.

No, my desire for a Mode A linear translator in no way a request to
not make satellites for others/other modes.

I don't see a basis for your comment/criticism because of my desire for
a satellite that I can use. You can have AO-40, or the FM birds or the
digital ones, I just have a limited budget and would like a Mode A
bird...

Furthermore, I wouldn't want only Mode A birds because I would like to
try the other modes later when I have some time. I think some of the
other modes are probably "better".

I think you were a little quick to extrapolate and then criticize.

I had exaclty this setup and got into EME after hearing some stations with it. You will be able to copy stations with this type of set up and 200-300 watts. You will not do much better than that. I eventually took my satellite system down to put up an array for EME after the getting a taste of it

If you don't understand why it would be a problem for others to start using
another band, then what is *your* problem to do so?
(i.e. why not just start receiving on 13cm?)

Star Trek seems to have led a few people to think launching a spacecraft is a trivial thing. It is not. it is remarkable that anything can be tossed up there and remain functional, let alone return intact.

I give the ARISS teams a LOT of credit for having the guts to try. I think I read where the electronics began development 15 years ago. That is a hell of a lot of hard work and I think it deserves better than "Big FUBAR", (even if meant in jest).

Considering the ratio of sucess to failures I am no longer impressed.

I would suspect everyone involved feels as if they lost a loved one. Reading the messages you can hear the dissappointment in those that have had no hands on or financial involvement with AO-40. Just imagine if you personally had spent years of your time on this bird. I feel a bit of Happy has faded from their Holidays!

Good news

NORAD have confirmed that A0-40 is still in one piece and is being actively tracked.

So who ever started telling tales that the bird blew up can eat his words!

I am very optimistic the computer crash will be rectified.

Whooo!!

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

Provided by Ken Ernandes, N2WWD

NORAD / Space Command determined an accurate set of Keplerian elements for AMSAT OSCAR 40 using tracking data from their radars at Eglin AFB, FL and the Kwajalein atoll. The tracking data has good time and geometric dispersion, yielding high quality Keplerian elements. Thus the following Keps supersede previous estimates:

AO-40
1 26609U 00072B 00354.78150463 .00000000 00000-0 00000-0 0 124
2 26609 6.2479 237.0656 8128421 195.4843 97.8395 1.26834511 611

Satellite: AO-40
Catalog number: 26609
Epoch time: 00354.78150463
Element set: 12
Inclination: 6.2479 deg
RA of node: 237.0656 deg
Eccentricity: 0.8128421
Arg of perigee: 195.4843 deg
Mean anomaly: 97.8395 deg
Mean motion: 1.26834511 rev/day
Decay rate: 0.00000e+00 rev/day^2

There is a lowcost kit available somewhere in the UK. Use a seach engine.

Glenn:

I agree with your post.

AMSAT's news bulletin (12/13/2000) indicated that the memory was getting corrupted on one of the AO-40 computers (and thus crashing) because of solar radiation. It seems that the amount of solar radiation AO-40 would have encountered should have been known and thus appropriate shielding installed.

If the hard reset of AO-40 does not work it will be a great loss for amateur radio. AO-40 had a design life span of 10 years. I suspect that over the 10 years millions of dollars of vhf/uhf/microwave gear would have been bought by amateurs world wide. For myself I was looking forward to assembling a portable L/S mode station (1.2 Ghz up 2.4 Ghz down). I bet Kenwood/Yaesu/Icom had new satellite radios on the design board because of AO-40. Cool portable microwave stuff we will never see.

It would have been nice to have AO-40 running in 5 years at the bottom of the next Sun cycle.

Oh well, too bad.
Sean - K3XT

Probably you should have invented appropriate shielding and offered AMSAT
the license to use it on their satellite!

Thanks for your comments Rob. While you do not have to agree with them, your comments should not assume that I am a totally ignorant "appliance" operator. Other amateurs can view my sarcastic comments in reply. They are interlaced between Rob's comments.

Rob Janssen <nomail@rob.knoware.nl> wrote in message news:slrn93s2d1.1el.nomail@linux.pe1chl.ampr.org...
> There already are *many* simple and cheap satellites. How do you think the
> numbering got up to 40? And then I am not even mentioning the RS series.

No kidding, and I thought the number 40 was a random assignment. So does that mean the other 39 sats are still operational? Duh, no! That's why we need sats to replace those that are no longer functioning.

> Why not try to make a somewhat more complicated satellite once in a while?

I have no problem building more complicated sats, provided that can be successfully built, successfully launched, and work for a reasonable time after they are launched. Also, time and cost are a big consideration here. Cheaper and faster is better so to speak.

> Do you think only appliance operators should be using satellites and there
> should be nothing for those who want to experiment, e.g. at SHF frequencies?

Experiment? Have at it. I support you 100% in your quest to do so. Now, I don't know what experiments you tend to conduct that have not already been conducted by private industry and the government sector with all their vast financial resources, but knock yourself out. But let's not forget all the applicance operators that just want to have a little fun communicating economically with the simple sats. Now, where is the power button on my rig? Hmmm can't find it...I wonder what that CW button is for......

> And why don't you consider that other amateurs may not like the use of
> low frequencies because they have a lot of QRM or have no place to put up
> the large antennas needed at those frequencies?

Exactly! So now they want to put up arrays of VHF, UHF and SHF beams high enough that they are over the surrounding tree line. So if they can't put up an HF vertical, how the hell are they going to erect small beams on towers? Hmmm? You know the mode A sats could usually be worked with a 2 meter antenna in the atic, 20 watts of power and receive the downlink signal on 10 with a ground mounted vertical. You can't get much more simpler than that. Now what end of that antenna does this coax thingee go into? I guess I can use that old car radio antenna on this rig, right?

> Don't you think they should be allowed to use a satellite using only a
> couple of small helices?

Sure, if they want to. I don't want to stop anyone.

> It looks like you are only taking your own situation (apparently owning a
> HF and 2M transceiver) into account, and conclude that must be the
> reference for "the majority of hams". Don't forget that there are many

Oh, nice insult. Facts are that I have more rigs than God (He told me so, and said He wishes He also had an Omni 6+). They cover every band from 160 meters to 1.2 Gig. So yes, I obviously own an HF rig and one of those (breaker, breaker) two meter rigs. Is it too much to ask for simple sats that can be successfully launched and work once they are in orbit?

> hams that have no HF license and hence no reason to buy equipment for HF.

Yeah, I guess so, as that blazing speed CW exam at 5 WPM is going to keep a lot of would be hams from upgrading. So I see your point.

> For them, a 10m downlink is just as complicated as a 13cm downlink is for
> you: they have to build or buy a converter and antenna.

Do you really believe what you just said? A 10 meter receiver is just as complicated as a 13cm downlink? Come on Rob, I did not fall off the tower yesterday.

Does the "AMSAT" in your e-mail address mean that you are going to support anything and everything they do, even if it is not smart or correct?

Merry Christmas to all and to all a Good Night!

Duffy

Great idea Mike, I could not agree more. We've got to keep it simpler and cheaper. Launching birds that take forever to build, cost millions of dollars and then blow up right after launch or stop working within a few weeks, isn't doing anyone any good.

Regards,

Duffy

AO-40 did use radiation hardened IC's because of the lesson learned from AO-10 (which still works pretty well after being fried many years ago.) Since AO-40 is still in one piece, it should be possible to get at least part of the system working.

Congratulations on the launch AMSAT! Keeping my fingers crossed for a successful reboot.

Unfortunately you have a few of your facts crossed. The IHU-2
(internal housekeeping unit 2) contains some unprotected memory.
However, the IHU-2 was not intended to be mission critical. It
does contain some protected memory as well (I think radiation
hardened, with error correction) as well as some flash ROM.
The IHU-1, which is the main computer, is mission critical,
and has protected memory.

Since the standard telemetry beacon is on 70cm, and not currently
working, the IHU-2 has been repeating the data onto its 2m transmitter.
When the IHU-2 crashes, which it does because the repeater program
is in unprotected memory for convenience, it stops working. The
IHU-2 just needs to be reprogrammed in this case; the IHU-1 is
still working.

So, in short, there is sufficient shielding on all of the
mission critical components.

There are still *many* satellites operational. You seem to treat them like
sixpacks of beer that should always be in stock so you can never run out of
them... In reality, there has been a long time they were launched one by
one and you did not have 15 operational ones to choose from.

>> Why not try to make a somewhat more complicated satellite once in a while?

>I have no problem building more complicated sats, provided that can be
>successfully built, successfully launched, and work for a reasonable time
>after they are launched. Also, time and cost are a big consideration here.
>Cheaper and faster is better so to speak.

Only if you forget to consider the whole picture. All those cheaper
satellites are in a low earth orbit, and cannot be reasonably compared to
the Phase 3 sats, in range or convenience of use.

>> And why don't you consider that other amateurs may not like the use of
>> low frequencies because they have a lot of QRM or have no place to put up
>> the large antennas needed at those frequencies?

>up an HF vertical, how the hell are they going to erect small beams on
>towers? Hmmm?

Phase 3D can easily be worked with a couple of small helices attached
to an appartment building balcony. With LEO sats this is inpractical
because you need to see most of the sky not to cut back on the already
short pass times.

>> Don't you think they should be allowed to use a satellite using only a
>> couple of small helices?

>Sure, if they want to. I don't want to stop anyone.

What you and many others seem to forget is that radio amateurs cannot just
put up any satellites they would like to have. A couple of cheap LEO's,
a Phase 3 bird, a constellation of 3 geostationary sats with interlinks,
there are many things we would like to have.
But when you say "spend the money on a couple of simple sats" you are
essentially saying "forget about more complicated ones".

A choice has to be made. And in the current situation, I don't consider it so bad that AMSAT focusses on more hightech sats, because there are a lot of other organisations (schools, universities etc) that are going to build microsats anyway and will make them available to amateur radio. (that is how we got this huge number of small satellites over the past couple of years)

Maybe not with the MODE-A transponder you would like, but with a lot of other interesting experiments. When you want a MODE-A transponder, maybe you should talk to such a group instead of to AMSAT.

>> It looks like you are only taking your own situation (apparently owning a

>(breaker, breaker) two meter rigs. Is it too much to ask for simple sats
>that can be successfully launched and work once they are in orbit?

Please indicate the relation between simple satellites that work and the use of low-frequency bands. Why can't a UHF-SHF satellite work? It could even be simple, simpler than P3D is now. Part of the reason P3D got so complicated is that amateurs apparently can't live with a simple UL/S transponder and want inputs and outputs on all possible bands. Originally it even had a 10m downlink, but apparently that was scrapped.

>> hams that have no HF license and hence no reason to buy equipment for HF.

>Yeah, I guess so, as that blazing speed CW exam at 5 WPM is going to keep a
>lot of would be hams from upgrading. So I see your point.

Here you are again considering only your own situation!
There is no 5 WPM license in this country, and the 8 WPM license does only give access to small segments of HF bands. A full HF band license requires 12 WPM. There are many more VHF+ licencees here than all-band licencees.

>> For them, a 10m downlink is just as complicated as a 13cm downlink is for
>> you: they have to build or buy a converter and antenna.

>Do you really believe what you just said? A 10 meter receiver is just as
>complicated as a 13cm downlink? Come on Rob, I did not fall off the tower
>yesterday.

For someone who does not own a 10 meter receiver, a converter must be built to a band he owns a receiver for. When you want to uplink on 2 meter, that will probably be 70 cm. A converter from 10 meter to 70 cm is not much simpler than a 13 cm to 2m or 70 cm converter, using modern parts. Certainly not when you can use a surplus S-band converter.

>Does the "AMSAT" in your e-mail address mean that you are going to support
>anything and everything they do, even if it is not smart or correct?

No. But I do back their standpoint that it is not smart to keep building MODE-A transponders just because they are so easy to operate with HF band equipment.

>Merry Christmas to all and to all a Good Night!

Same to you.

Rob

Mode A birds ? only 1 RS-12/13 that I know of - and it's reaching
the end of it's life (10 years this February). It's in either mode
K or Mode T now. Many of the others require specialized equipment that
for budgetary reasons excludes many people...Unless that's the
point...

> Only if you forget to consider the whole picture. All those cheaper

So AO-10 and the late AO-13 are/were easier to use ? Huh ? maybe if
you have several kilobucks to spend putting up specialied antennas,
rotors, and radios.

> Phase 3D can easily be worked with a couple of small helices attached

> short pass times.

Phase 3D cannot be worked at all, nor has this been proven. I've heard
this kind of trash from AMSAT before about how easy one can
work a satellite (FM sats with a rubber ducky). Yes, in theory that
can happen. Reality is that everyone with a 2m/440 radio tries this
and you can't get in. Yes I'm sure some people have gotten in
occasionaly, but the probability is low that any one person will get in.

> A choice has to be made. And in the current situation, I don't

radio.
> (that is how we got this huge number of small satellites over the past
> couple of years)

Most of the those satellites are downlink only ones. Real exiting...

> Maybe not with the MODE-A transponder you would like, but with a lot of other interesting experiments. When you want a MODE-A transponder, maybe you should talk to such a group instead of to AMSAT.

Wish I knew who to talk to. I did drop my AMSAT membership years ago because of this bias.

> Please indicate the relation between simple satellites that work and the use of low-frequency bands.

The relationship is that using a 10 meter downlink is that most hams have an HF radio. Even a shortwave radio with a wire antenna works. Very cheap. The only think you need is a 2 meter transmitter - say like an old Ameco 6n2 50 watt one. The point is that now satellite stuff is within the reach of more people.

Why can't a UHF-SHF satellite work? It could even be simple, simpler than P3D is now. Part of the reason P3D got so complicated is that amateurs apparently can't live with a simple UL/S transponder and want inputs and outputs on all possible bands. Originally it even had a 10m downlink, but apparently that was scrapped.

For someone who does not own a 10 meter receiver, a converter must be built to a band he owns a receiver for. When you want to uplink on 2 meter, that will probably be 70 cm. A converter from 10 meter to 70 cm is not much simpler than a 13 cm to 2m or 70 cm converter, using modern parts. Certainly not when you can use a surplus S-band converter.

I think a 10 meter receiver (even a shortwave set) + antenna can be acquired cheaper and setup easier than that a surplus mode S-band converter.

> No. But I do back their standpoint that it is not smart to keep building MODE-A transponders just because they are so easy to operate with HF band equipment.

It's probably not smart for a Mode A transponder for a Phase 3D satellite with it's highly eliptical orbit. But it makes sense for LEO satellites.

Anyway, I hope AO-40 comes back. Maybe I'll have some bucks saved
for new equipment to work it...

Rob,

You convinced me to not support AMSAT any longer and that I did make the wise decision to drop my membership. You folks want to do what only interest you and you fellow hams. So, go ahead and launch your sats, I hope they work and you all have fun. I guess the rest of us can find a way to support the Russians. They seem to know how to build 'em fast and cheap and within reach of the average Joe-Six-Pack-Ham. They also listen much better than AMSAT and try not to put words in our mouths that just aren't there. You can't see the forest for the trees my friend.

Regards,

Duffy

Do you think "I am AMSAT"? Just because I have an @amsat.org address?
You are mis-informed. amsat.org addresses are available for any ham,
not just Amsat members, and certainly not only for Amsat board members.

Face it, A0-40 is gone. People didn't want to let Elvis go either. Just like there are Elvis sightings, there are now AO-40 sightings. It's time for a command station to issue AO-40 a ctrl-alt-del to confirmed death so we can all move on with other things and end all this blind hope.

3464. Re: AO-40

If you had bothered to read the information that has been published about AO-40 you would know that the IHU-1 is radiation hardened. The IHU-2, which is an experiment and *not* an essential system, is not. IHU-2 is not required to operate the spacecraft and the additional expense of making radiation hard could not be justified. It was IHU-2 which was crashing when passing through the radiation belts.

That a radiation hardened IHU can be an extremely reliable device has been proven many times. AO-13 operated reliably for years, for example.

Oh, and how many satellites have you controlled?

AO-10's command team worked long and hard before giving up, and I think the effort really ended ony after ArianeSpace admitted their booster had hit our satellite at separation. That was a month or so.

And no, I haven't controlled any satellites either. That's why I'm not second-guessing the people who have.

Rob's memory is correct: AO-10 and AO-13 both had launch insurance, which covered the launch but not the satellite's operation. If AO-40 had had such a policy, it would not have paid because the launch itself was successful. However, AO-40 is a much more expensive bird than those were, and the satellite's owner (AMSAT-DL), after investigating fully, decided that insurance would be prohibitively expensive.

Hello
What would happen if we went down to Radio shack, bought a RS repeater controller, HT, a few solar panels and some nicad batteries. Put all of it in a coffee can. We would bribe a member of the STS team to put it on board the shuttle. Just kick the damn thing out the door. Vola' AO-41. Total cost outlay $500 plus minus bribe. Why not?? We do the same thing with high altitude balloons. I have used the same set up in the Rockies as a impromptu repeater covering a 200 mile radius.

Am I correct in thinking that that the 2M Middle Beacon on AO-40 can only be activated via the non-hardened IHU-2 computer?

Given that the 70cm beacons (driven directly from IHU-1) are not functioning and assuming that the problem lies with the non-hardened IHU-2 is there still a viable way to command and control the bird?

I have read somewhere that when the IHU-2 is powered down, the relay
function is automatically active (probably using an electronic switch that
connects input to output). The repeater program would only be required
to relay the telemetry while IHU-2 is powered up. They certainly did not
want to power it down right after launch, as it contained all the
recordings made during launch and separation. So the repeater program
was uploaded.

My guess is that when the IHU-1 is reset, that will power down IHU-2
and the beacon can be switched to 2m for IHU-1 uploading and then IHU-2
can again be activated by command and upload of the software.

They had a lot problems initially with the Hubble space telescope
flying through the SAA corrupting the memory quite quickly.
Fortunately ECC was used on the memory and by flushing the memory
frequently (reading the memory word and writing it back with
recalculated ECC), the single bit errors developed in a single memory
word could be corrected before multiple non-correctable errors
appeared in the same memory word.

I have no idea, if this could be used on AO-40.

RS-12/13 still works very well. I hear it every day when looking for
AO-40.
Please explain what specialized equipment you would need. Usually just
two FM radios and a G3RUH modem. Hardly specialized, any packet radio
user who did not fall asleep over his 1984 AFSK modem has these.

Convenient. That is not necessarily the same as easy.
Reasonable pass durations. Listening on the band, picking out an
interesting station to call after he has finished his contact. Exchanging
some station information and chatting about other topics. Not just those
"you're 5-9 in JO22NB please QSL via the bureau 73" QSO's.
Tracking possible by hand without automatic rotator control.

Do you need the easiest way to work cross-continent? Dial a phone number.

That is right, published link budgets are usually for the transponder
operating at zero AGC level and in practice we will have to see.

>The relationship is that using a 10 meter downlink is that most hams

Do you have statistical data that backs that up? I don't have an HF
radio... My license is valid for VHF and higher only. Over half of
the amateurs here have such a license.

I think that the typical amateur attitude of comparing pricing to the
last buck and always buying the cheaper option (thereby spending the
money and cutting away the possibility to get something more advanced)
is seriously hampering any progress. This can be seen in many other
areas of the hobby, including packet radio. Most computer hobbyists
would be laughing at anyone still using a 1200 bps modem on the telephone
line, they have upgraded their modem 3 or 4 times since that era.
Not so for radio amateurs, they claim that "1200 baud is cheaper",
"9600 baud is advanced technology they can't afford", etc. They ask
for infrastructure to be deployed (including satellites) that still
allows them to use their 15 year old modem, even when manufacturers have
long stopped production of ICs to build new ones. Strange.

>Anyway, I hope AO-40 comes back. Maybe I'll have some bucks saved
>for new equipment to work it...

That's what we are all hoping for.

Here's a great webpage for realtime tracking of almost any satellite.
http://liftoff.msfc.nasa.gov/RealTime/JTRACK/3d/JTrack3D.html

You will need JavaScript capability on your web browser to run an Applet.
There's also capability to track/ sight satellites from your own location.
Not specifically designed for amateur radio but fun nonetheless.

I am not even a member... I just observe what they are doing, and
sometimes make a donation. Don't take my postings as representing AMSAT,
because they aren't.

I happen to agree to their choice of trying something more ambitious than
what has been tried 39 times before. I disagree with their policy not to
distribute detailed information about satellite status and recovery options
and progress. (although that is probably not a policy perse, the effective
situation is the same)

A short Novel, by Kepler 'The sinking Ship'

ao-40 is like a ship that has capsized and is upside down in cold murky water. Its supporters & contributors cling to the sides in vain hopes of rescue, but as time go by more and more of them with failing strength slide silently into the depths of the cold murky water until nothing is left. Only a few stale keplerian element sets remain as a reminder of the tragedy.

the end

RS-12/13 is almost 10 years old. When it dies, that's it. RS-10/11
didn't quite make it to it's 10'th birthday. Yes it works now.

I don't have a G3RUH modem. Not specialized, but not free. Regrettable
I have budget constraints.

I enjoy the quick contacts on the RS birds. Putting up the larger
antennas required by AO-10 and AO-13 isn't possible to me. I operate
the RS birds with a 1/4 vertical in my garage attic, listen to the
10 meter downlink with a dipole in my house attic. As far as
picking out interesting contacts, I do that on 20.

> Do you need the easiest way to work cross-continent? Dial a phone
number.

No kidding, you missed the point. RS & Mode A is fun, affordable and
at my QTH "do-able".

<....stuff about ham cheapness deleted...>

Oh sure, hams are a cheap bunch, no question. On the flip side, family,
mortgages, car payments, college education and retirement funding comes
out of my paycheck first. Ham Radio (or any other hobby here) takes a
back seat. Therefore when I get a piece of equipment, I want to use it
as long as I can. I found Mode A to be fun, and I'm disappointed AMSAT

doesn't support it, and when RS-12/13 dies, that's it. (It's actually in Mode T now I believe).

73, Merry Christmas. Maybe Santa will bring you AO-40.

Rod

Wait a minute Rod, not all hams are cheap. I'm not cheap as you well know. But you are the cheapest ham I know. Poor old George Washington hasn't seen the light in years. Abe Lincoln's beard will wear off before a penny ever leaves your pocket.

Funny, about this Rob guy though. For a guy that's not a member of AMSAT, he sure seems to a Mr. Encyclopedia on amateur sats. Really, AMSAT needs to get this guy on board to run things. He knows so much more than they do.

Merry Christmas Everybody and I hope AO40 comes out of its sleep. Would be a nice Christmas present.

Regards,

Duffy

I almost got a sense of his being pleased that AO-40 is in trouble. I am as concerned and disappointed as the next guy, but I wouldn't find any satisfaction in posting a message such as he did. At this point, all I can do is hope for the best; I generally save prayer for bigger issues.

Nope! I believe the Eveready bunny is just taking a nap, they may have to spread the solar arrays to get some power to the computer and then figure out how to position it with the panels out.

Don't worry, be happy.

Eventually, somebody will collect this satellite and return it to earth or
repair it.
NASA went and repaired the Hubble Space Telescope didn't they?
It will either get in somebodies way or space flight will become so
commonplace that this satellite will be retrieved.
It's just a mattter of time.

Umm well, I doubt it.. because the failure took place as the motors
were being manipulated for orbital configuration. However, on the bright
side the thing is in one piece and I'd say the on board computer may
have crashed or worse is dead brained. Can they recover.. I sure as hell
hope so as I contributed money to the project and imagine
the pain the developmental team is going to feel if this thing is a dead
doggie..

Source record: 7224

At the national AMSAT-NA convention in Tucson a few years back, a paper/discussion was held concerning the lack of future "easy-sats" being built. At that time, the AMSAT officers did not anticipate the gob of Mode J analog FM sats being constructed, but their comments were aimed more at the mode A and Mode K Russian "easy-sats". Nearly all in attendance at that meeting agreed that it would be a tragedy if the Radio-Sport sats all died without any replacement for easy operation of Modes A&K. These were the sats that got most current ham sat enthusiasts hooked in the first place. If AO40 comes back alive, it will actually fulfill much of that role. If it doesn't, we need to rethink doing $5M projects that take 10 years to build and get launched, and can only be sent up on one or two rockets made in the world, and that are overly complex, by ham standards. Otherwise, IMHO, the ham space program, outside the ISS is probably dead. Let's all pray for an early recovery of AO40.

3494. Re: Is AO-40 insured?

Newsgroup: rec.radio.amateur.space
Date: 2000-12-23 04:21:20 UTC
From: David Reinhart <wa6ilt@bellatlantic.net>
Message-ID: <3A442869.5B59BF36@bellatlantic.net>
Source record: 7228

You may be right. I've seen postings on amsat-bb stating that both AO-10 and AO-13 were insured. I wasn't working satellites when those birds were launched. My opinion came from the discussions I've heard/had on the subject of launch insurance at the two symposiums (symposiae?) I've been to.

Don't get your hopes too high. If ET hasn't called yet something quite dire has happened which may not be fixable even with a rebooting. They do-not know if the bird is even hearing ground command sigs. Now, that's really operating in the dark and hoping for Santa Clause to fix whatever is wrong. Don't get me wrong I'm depressed if this sat is dead, because we shall not see another in many many many years!

3499. AMSAT Special Bulletin - AO-40

Newsgroup: rec.radio.amateur.space
Date: 2000-12-23 06:49:59 UTC
From: George Hiscox <ghiscox@earthlink.net>
Message-ID: <lmi84t8chck3fcnhoq4tf5f00n9bpcbvh6@4ax.com>
Source record: 7233

AMSAT Special Bulletin
AMSAT-NA President Robin Haighton, VE3FRH, provided ANS with the following 'President's Letter':

To All AMSAT Members,

It is proposed to hold an inquiry into the incident which has resulted in the loss of communication with AO-40. Although it is hoped that the loss of communication is a temporary situation, AMSAT believes that it is in the best interests of our organization to determine all the facts surrounding this incident and to make sure that a similar situation cannot happen again either on AO-40 or on a future satellite.

Our primary function at this time is still the recovery of AO-40, but we are also beginning to lay the plans for this inquiry.

When the P3D project was first developed, a Program Board was developed to oversee the project and put in place such other committees as may be necessary during the life of P3D (now AO-40). This Program Board represents the membership of each of the major organizations which have contributed to the P3D project (i.e. AMSAT-DL, AMSAT-NA, AMSAT-UK, DARC, and the ARRL). It is this Program Board that will meet on your behalf to determine the requirements of the inquiry, such as the terms of reference and the actual size of the Inquiry Committee itself.

The Program Board will be responsible to make sure that the inquiry meets the requirements of the membership and will be responsible for publicizing the results of the inquiry.

AMSAT-DL will present the Program Board with some initial suggestions on the scope, size, etc. in early January 2001. The Program Board will review these within two weeks and make any modifications that they feel are necessary (during a teleconference) also to be held in January.

It is hoped that the Inquiry Committee will start work shortly thereafter.

Although we do not wish to limit the scope of work, we would like the Inquiry Committee to report its findings relatively quickly, with this time to be determined by the Program Board. Any or all the AMSAT personnel who worked on the P3D project may be asked to assist the Inquiry Committee.

On a slightly different -- but related -- topic, in order to make sure that everyone is up to date with known facts, Peter Guelzow, DB2OS, is preparing an overall review of the loss of transmission incident, to show what has actually taken place and the actions that have been attempted to try and recover AO-40. This is being written in response to many requests for detailed information and will contain all known information. Peter, like the rest of us, is a volunteer with a normal job, but he hopes to have this review out shortly.

Another action that is underway is a review of future projects by the AMSAT-NA Project Committee. For some time we have been receiving input for the next generation of satellites and this information has been passed to the Project Committee for their review and recommendation. We realize that even when AO-40 is hopefully recovered, now is also the time to start looking at our next project(s). The Board of Directors of AMSAT-NA will meet in late February to receive initial recommendations from the Project Committee and to determine the next steps.

Wishing you all the very best for the holiday season,

Robin Haighton, VE3FRH

I think that is great news!
Such a document will certainly help the world through this (hopefully)
period of silence from AO-40, and will maybe even help the recovery.

(by giving info to all the listening stations what to listen for, where, and
when)

>didn't quite make it to it's 10'th birthday. Yes it works now.

As you will know, these later RS spacecraft are not standalone but are
subsystems of Russian governmental satellites (observation, navigation
etc). That makes it a little easier to build something, as you don't
have to provide powersupply, attitude and orbit control, housing and
temperature control, etc. In the days of RS-12/13 the future seemed
to be very bright as there was a whole series of similar "host" satellites
to be launched and every interested party would have the opportunity
to put an experimental package on them.
Unfortunately, shortly afterwards the demise of the USSR and heavy
budget cut-backs destroyed that opportunity.

So now, building a new mode-a sat will be a bit more complicated than
it was before.

>I don't have a G3RUH modem. Not specialized, but not free. Regrettable
>I have budget constraints.

When you can live with somewhat degraded performance you can use software
and a soundcard to emulate it. This configuration allows the emulation
of many modems used in amateur radio. You only need a reasonably fast
computer (say a P166MMX or better), but most amateurs do seem to have the
budget for that (or ways to acquire it cheaply).

>Oh sure, hams are a cheap bunch, no question. On the flip side, family,

>as long as I can. I found Mode A to be fun, and I'm disappointed AMSAT
>doesn't support it, and when RS-12/13 dies, that's it. (It's actually
>in Mode T now I believe).

I don't know if AMSAT officially does not support it, but I have heard
the story about moving on to UHF/SHF many times (on sat colloquiums etc).
Remember AO-40 was initially designed without a 2M downlink, but AMSAT-UK
members donated money and had a UK amateur build a 2M transmitter. I

think there was no opposition to that from AMSAT, they just did not want
to spend their own money on that.
(right now they are probably very thankful they have the 2M output)

>73, Merry Christmas. Maybe Santa will bring you AO-40.

I hope so. In fact I hope somebody will press the reset button, as I
no longer believe in the watchdog operation.

Best wishes,
Rob

Yes, Abe did have a beard until he entered your pocket.

To my fellow hams, I would like you all to know, that WI0T travels from Missouri to Dayton every year to make such major purchases as a roll of solder, and a P.O.S. old Dumont rig converted to 6 meters (a $25 purchase) which had more emissions outside 6 meters than it did inside the band.

He will go and visit every dealer at the Hamvention to find the dealer with the absolute lowest pice even if we are talking about a difference of $.50.

I do hereby propose and make a motion that WI0T be elected President of AMSAT. For if elected, Rod will have plenty of amateur sats orbiting the earth that will probably cost no more than $100 each because only he can squeeze a penny until Abe begs for mercy.

Do I here a second?

Regards,

Duffy

Please allow me to be the Devil's advocate for one posting here. And
let me qualify what I am about to say as someone who is still hopeful
that AO-40 has not run out of options.

I think the 'Sinking Ship' story was more of an observation about what
the author has been reading on this news group rather than his
pessimistic attitude to the bird. His observation is that others on
this news group might be a little quick to abandon ship.

There now, no need to arm bears after all 8-)

I agree 100% with this portion of the thread. I have been a ham for 26 years but only got into sats in the last couple of years, just after AO-13 died. I very much enjoy RS12/13, FO20, & FO29. A few more like these would be a great idea, especially if they also included a microwave transponder. That way we could continue the AO-40 plan to develope the microwave spectrum while at the same time not putting all our eggs in one basket.

Tom

I'm in favor of going off the 430Mhz band, for the slightly
selfish reason that there's an ATV station across the SF Bay
with near line of site to me, that constantly
broadcasts weather maps 24 hours a day right on top of the
satellite band. He shows the same picture,
over and over again, so depending on the spectral weirdness
of the current weather, various bits of the satellite band
get blown out.

The problem with microwaves in LEO sats is the huge doppler change rate,
and the usually narrow beamwidths of microwave antennas.

This means that microwave LEO sats will be only practical for fully
automated stations, that have both their rotators and their transceiver(s)
controlled by a computer, and have accurate keplerian elements and time
of day available.

Without such help, the task of pointing the antennas and tuning the
transmit and receive frequencies will be too overwhelming to make a
QSO at the same time.

This fact will of course cause lots of whining from those that don't have
such a setup and consider it too difficult or too expensive to construct.

3510. AO-40 Update from IRC

Newsgroup: rec.radio.amateur.space
Date: 2000-12-23 21:46:45 UTC
From: George Hiscox <ghiscox@earthlink.net>
Message-ID: <c67a4tkhsafq14dko553m9kdropvs59sf9@4ax.com>
Source record: 7243

From the AMSAT IRC channel:

"Even during the Christmas days, AO-40-command stations are active.
Peter G?lzow, DB2OS, told that after another attempt of commanding
AO-40 without reaction, it must be assumed the IHU-1 has crashed.
Preparations of a special RESETsoftware are underway to switch
transmitter and IF-matrix immediately to 2-m-MB without uploading the
whole operational software before. The RESET can be tried on one of
the days following a successful testing of the software on ground."

Now it only had 2 emissions, 1 of which was the 6 meter band, which
ain't bad. Too bad the other was on the St. Charles County Sheriff's
frequency...

Oh, and it was some resistors and a QSL card holder. I got the solder
at a local hamfest...Get your facts straight!!

It won't fulfill Mode A/K (aka EasySats), but it will allow another
step up for current satellite ops. However once RS-12/13 dies the
entry into ham satellites will be raised a notch. So while I want AO-40
back, It won't do me any good w/o significant expenditure of money
and time (assuming we build antennas).

I think we need the LEOs to attract people to satellites and then
we need the AO-40 types to continue - FM LEOs don't work nearly as well
as a Mode A with a linear transponder, and I'm sure satellite operators
get bored with the short LEO AOS-LOS time.

Otherwise, IMHO, the ham space program, outside the
> ISS is probably dead.

That might be premature, but I can't see how AMSAT could raise much
money again.

73 es Merry Christmas.

Doppler would certainly be an issue, but one that we can live with. An
extremely narrow beam on the earth station is not necessarily be
required. It would depend on the sat design.
Anyhow, what I really had in mind was a mode J or mode A bird with a
microwave downlink or uplink.

Just my opinion,
Tom

To date, no manned orbital flight has been in the region of geosynchronous orbital altitudes, so there's a long way to go for a retrieval/repair (ala Hubble) to take place. I believe that there is a radiation risk to humans in certain orbital domains in that region as well.

Yes, I am quite aware that the satellite is "way out there" as you put it.HST's repair proved that things can be retrieved in space. There is a lot of "Space Junk" floating around in orbit. Eventually it will get in somebody's way, or someone will collect it as a "Space Antique". I don't know how soon, but unless AO-40's orbit significantly decays, someday it will be retrieved if only as an historical object by our great-grandchildren.. But IMO I don't think it will be that long.

Hubble's orbit, which is very nearly circular to begin with, was lowered
to about 250 miles each time it was worked on. This would then presume
that we have power and control over AO40, which we do not (at the
present time). The chances of retrieval of a $4M amateur spacecraft by
a $100M shuttle flight are somewhere between slim and none. Physics and
economics just don't see that one in the cards.

3522. VK3JED Comments RE AO-40 Recovery Efforts

Newsgroup: rec.radio.amateur.space
Date: 2000-12-24 16:16:32 UTC
From: George Hiscox <ghiscox@earthlink.net>
Message-ID: <128c4tgn1s73c4hci13l24o0a0r9d7p17h@4ax.com>
Source record: 7105

The code did what it was supposed to do, which was cycling the
He highpressure valve as part of the work on the propulsion system.
After the first burn it was noted that a valve on the the high
pressure side did not fully opened, thus it took a long time until the
fuel tanks reached normal operating pressure and once the motor
started, the pressure was going dropping again.

The error message you have seen simply means, that the definition
for "MANY_ARMS" was already loaded into the computer. This is
like trying to compile a program with two subroutines with the
same name.. Thus IPS aborted this upload and complained, nothing
happens. The command station probably sent this block twice,
but this is no harm.. The blocks you saw were special telemetry when
the program was executed.. not a crash..

Glad to see that more people now trying to understand how
IPS works.. :)

I'm started working on a more detailed report, but handling all
the eMail traffic isn't easy too.. and indeed I still hope that
this report might get obsolete in the next 1-2 days..

The IHU-2 is an experimental computer, which was very helpfull to
download the separation images and use the camera as an additional
tool for navigation. Otherwise the IHU-2 has no other function and no
access to the spacecraft bus. It shared however the Middle Beacon
with the IHU-1 and since there is only a MB (due to the smaller
bandwidth on 2m) on the V-TX, a repeater program was needed to get
IHU-1 telemetry. We could also simply have turned the IHU-2 off and
than the MB will automatically carry the IHU-1 telemetry using a
hardware switching logic.

The IHU-1 is made of radhard components, in particular the 1802 Cosmac
CPU from Harris/Sandia and also the EDAC Memory is made of radhard
RAMs. I suggest reading articles about the IHU-1 design, which was
published elsewhere.

Indeed, it can not be excluded that a part got hit by a particle and
produced an SEU, causing the IHU to crash. We will see when the
Reset/Reload procedure for the IHU-1 get's started, which will happen
probably already today..

The only posibility would seem to be if it could be done as a minor
side project piggybacked onto another mission. That makes the odds even
slimmer that circumstances would fortuituously team up to make that
possible at all.

I guess the easiest thing in the world to do, is to set back and do nothing. This makes sure you can never screw up anything, while ridiculing any attempt by others that may go less than perfect. This is the same group that finds fault in the way we live our lives, worship our God, abhor sexual deviance, etc. and etc.

Had these folks had their way at Kitty Hawk, we would all be taking the train. I for one am sick of the nay sayers until they get off their lazy butts and accomplish anything, however slight. Until then shut up. The rule needs to be "No contribution, No comments"

Merry Christmas to Men of good will.

Yes, but Fred...if you want to get a close-up view of how "Momentum" and desire to keep the project on schedule get in the way of doing it right, read the late physicist Richard P Feynman's report on the investigation of the Space Shuttle Challenger disaster.

Feynman was a member of the special commission which did the investigation and if not for him and his firm insistence on *doing it right and fully reporting and disclosing ALL the facts* we'd still not know what caused the disaster. It woulod have been swept under a carpet of doubletalk and obfuscation.

I found his report in the book "The Pleasure of Finding Things Out",The Best Short Works of Richard P. Feynman, by the author, as "Richard P. Feynman's Minority Report to the Space Shuttle Challenger Disaster Inquiry", chapter 7 page 151. Helix Books, Perseus Books Group. ISBN 0-7382-0349-1 http://www.perseuspublishing.com.

Note that his was the "Minority Report" which contained exactly what he found to be the facts. He wouldn't have done it any other way.
Makes you wonder about some of the many spin doctors operating here on rrap and so many other areas today.

Dick

3527. Orbit -- over the equator but not geo-synchronous

Newsgroup: rec.radio.amateur.space
Date: 2000-12-24 18:25:53 UTC
From: Cathryn Mataga <cathrynm@junglevision.com>
Message-ID: <3A463FB1.F57BD809@junglevision.com>
Source record: 7111

I had a thought. At the risk of annoying the 'build a satellite before you comment' trolls. What about an orbit, that's just over the equator, but isn't a geostationary orbit. That is, say a little lower, or maybe quite a bit lower -- so the satellite would track around the equator every day or so. Make the transponders high in frequency. 10Ghz or so.

And, then, I think this is right, it would be possible to track this satellite with only a single rotor? So, since the satellite is over the equator, the orbit always tracks over the same piece of sky exactly.

What I imagine would be a ground station that consisted of a small dish that looked similar to a Satellite TV Dish, which would affix to the side of your house -- or I guess on the roof if you live in Venezuela or something. With a single motor that could track the orbit automatically. If the dish is small, this would be a cheap and light little motor. Something like the big dish satellite receivers where you could tune in various GEO synchronous satellites.

Make the frequency of the transponders high, so that smaller dishes would give the better gain. The doppler would also be exactly the same, every orbit, (err, I think), so that tuning could be programmed from a static table of frequencies.

This would solve the 'Only the Western/Eastern Hemisphere' problem with a regular geo-synchronous orbit. But, would still give us a system that is, err, at least by one degree of freedom easier to track. Also, to the extent that the antenna looks like a DSS dish, then the people here in the US who have deed restrictions could easily put up stealth antennas.

I suppose people near the poles would be left out. But, still, this would cover a most of the planet as a compromise? Hmm?

'No contribution, no comments'
I think I saw that in the Bill of Rights somewhere.
Besides, the thing at Kitty Hawk flew.

ARSENE was (or is) in an orbit a bit like that. It looked very
promising, but unfortunately the builders of the satellite put a
totally useless payload on it, that never worked but would not have
worked in practice when they would not have forgotten to plug in
the antenna.
There was a mode-S transponder, but it was weak and narrowbanded.
It stopped working after a short time.

That was a wasted spaceframe, IMHO.

Yes. But the orbit will not remain like that without propulsion.
Influence from sun and moon will make the inclination increase, I
believe to 8 degrees or so.

ARSENE was a lot of fun, but mode S gear for that part of the band was rare, and the bird had heat problems eat it up. You still need both az and elevation rotators unless you live on the equator. Then you only need an elevation rotator. Look at it this way. If you live in North America, and the bird was in a nongeo orbit over the equator. At some time it would creep up to your horizon 0 degrees elevation in the southwest. It would continue to crawl to the east gaining elevation. The elevation would peak when the satellite was due south of you. Then it would go back down until the bird went below your horizon in the southeast.

I have to think about this some more. But, I believe there is a single
rotor solution to track such a thing. Let me think, what if the axis of
the rotor was tilted north, so that it pointed towards the center of the circle
that the satellite would make in your sky. And, then point the antenna,
at an angle to the mast, so it pointed directly at the satellite when
it was due south. Then, that works -- right? Hmm, this is a little
confusing.

On the equator your rotor is points exactly horizontally. But, it begins
to tilt up, as you go north or south from the equator.

3532. AO-40 RESET Attempt - Update

Newsgroup: rec.radio.amateur.space
Date: 2000-12-25 06:17:08 UTC
From: George Hiscox <ghiscox@earthlink.net>
Message-ID: <hhpd4tcvflbeb82pcrs5lv5sc9it0md4kg@4ax.com>
Source record: 7116

25-Dec-2000 / 0300Z
The command team has made some initial attempts to force a hard reset, with no apparent success. They will keep trying.

Peter Guelzow posted the following:

Dear All,
Command stations have already started sending RESET commands to the spacecraft and to upload a small program to re-configure the TX and MATRIX for Middle Beacon on 2m.

So far, no success. Command stations will continue to reset & upload using different command receivers. Even if we do not have immediate success, there are still a couple of possibilities to try.

AO-10 is at close to the same spot in the sky at the moment as AO-40. Unfortunately some moron has figured out how to send 400 bps PSK with the proper downlink sync vector and is blasting away through AO-10 at the approximate AO-40 downlink frequency. He's transmitting AO-40 decoded telemetry frames from another program. Fortunately, this idiot is too stupid to put the telemetry blocks in the proper format and what appears is ASCII text in a decoded format, rather than true AO-40 telemetry blocks......

So, be warned if you see something which sounds like AO-40 on 2m, it may not be AO-40 ;(

This all isn't funny, but let's think positive..

73s Peter

Sounds like what has been described is the application of a polar mount antenna, used in C-band satellite TV reception.. The axis of rotation of the dish is parallel to the axis of the earth's rotation, the angle from vertical depending upon latitude. The description of the track (quoted below) is pretty much how you would describe the "Clarke belt", the imaginary line which the visible geosync satellites lie upon as viewed from any point on earth.

Keep in mind that a satellite with a lower orbit would not appear as high in the sky as the geosats, however the track would appear to be very similar in its arc, with the 0 degree elevation ends of the arc farther to the south (or north, if viewing from the southern hemisphere) than the Clarke belt.

To steer the antenna, only a simple linear actuator is needed unless the track of the bird deviates significantly out of the plane of the belt.

Absolutely. Correction for declination is an essential aspect of setting up a polar mount antenna. Perhaps I should have mentioned it in my earlier post. I made an inference to declination when I mentioned that a satellite in a lower orbit would have a lower zenith angle, hoping someone would bring up the subject of declination.

I think the assumption of this thread was that the satellite would be in a circular equatorial orbit. Seems to me that declination would be constant in that case, wouldn't it?.

In practical terms, the declination angle is compensated for by offsetting the boresight line of the antenna away from perpendicular of the rotation axis, toward the horizon. The lower the orbit of the satellite, the greater the angle will diverge from perpendicular of the rotation axis of the mount.

Yup, I was thinking circular orbit, though I never said that. But, you're
right. I think pretty obviously it needs to be a circular orbit to track the
same location in the sky from the earth. And, that's really the main point.

I don't know how hard this is to achieve, but I assume it's similar
to the geostationary orbits, so there must be some experience with this.
I assume, though, it'd still need to be a mother huge satellite to reach
such an orbit.

I thought of a name. Phase 3.5. Not quite geostationary, but
going in that direction. Rather than going for 5/10Ghz,
maybe it could be on 1.2/2.4 using using old C-Band dishes -- keeping the tracking
mechanism and everything. If people were running 7 foot C-band dishes, maybe
we'd get decent link margins, and would be able to do some interesting stuff.
Though I'm still partial to going higher in frequency, and smaller
in dish size.

3541. AO-40 Update - On the air !!! So Merry Christmas to US!

From: George Hiscox <ghiscox@earthlink.net>
Message-ID: <m9vf4t0k6mpidooan334ql2fdf2vai7bnc@4ax.com>
Source record: 7125

Dear All,

we just got information from New Zealand and Australia, that AO-40
is back on Air!!

At 2000 12 25 21:45 Ian, ZL1AOX sent a RESET command through L-band
and an initialization block to switch the S2 S-Band transmitter On.

Just after the first attempt the S2 beacon came on 2401.305 MHz,
Signal was about S5 to 6 which was comparable to when S2 was
heard last during testing.

At 2000 12 26 00:30 signal strength has dropped to below S1 over a
period of
30 minutes.

The beacon was confirmed by several other stations in Australia,
including Graham VK5AGR.

Assuming this is true, we have a long way to go, but it's sure a step
in
the right direction!!!

The next thing is trying to upload IPS...

All previous attempts in the last 2 days to turn V-band On were
unsuccessful,
so we changed the strategy to try on S-Band..

Merry Christmas and Congratulations to Ian!!

73s Peter DB2OS

3547. AMSAT AO-40 Element Set Number 17

Newsgroup: rec.radio.amateur.space
Date: 2000-12-26 06:44:41 UTC
From: vlfiscus@mcn.net
Message-ID: <t4gfipsihelu4a@news.supernews.com>
Source record: 7131
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

Provided By Ken Ernandes, N2WWD

The following are the latest NORAD/Space Command Keplerian elements for
AO-40:

AO-40 / OSCAR 40
1 26609U 00072B 00358.71368715 -.00000218 00000-0 00000-0 0 179
2 26609 6.1593 236.5032 8131813 196.8718 93.7933 1.26873926 676

These Keps have a 22 second along track difference when compared with
NORAD
set #16.

73 and Merry Christmas

Jens,

Thanks for the elaborate response. I'll take only some parts from it:

topcat <topcat@catconcert.org> wrote:

>Low frq's needs larger antennas, but in return, at least with LEO's,
>they can many times be unobtrusive and omnidirectional, which in some
>cases can make them MORE discrete than directional antennas for much
>higher frq's.

My experience with working satellites (both AO-10/13 and LEO packet
and linear satellites) is that you really need some directional antennas
for good results. Sure it is possible to do a "proof of concept" with
an omni, but when you want some repeatable performance you usually are
a few dB short. Once your antennas are directional you might just as
well spend some more effort and make them autotracking the satellite,
that really pays off!
(I do remember the attempts to work JAS-1 where I needed to tune two
transceivers, look at the watch and table of predicted positions, set
the antenna rotors, and type some test to the BBS at the same time...
It was *a lot of work* but also quite some satisfaction to see the station
autotrack a UoSAT, set the transceiver frequencies, and up- and download
messages without touching it, a couple of years later)

>A good reason to NOT have mode A on a bird like AO-40, since that
>would combine the disadvantages from both without any of the
>advantages. This of course only holds true at Apogee, at Perigee it's
>a different story.

Yes that is true. But the sat spends so little time at perigee that it
really isn't worth it to build a station that can only work at perigee.
I have worked AO-10 and 13 on mode B, and the situation is largely the
same there. You just *need* abt. 3m-boom yagis, except maybe for the
occasional contact that proves that is not true. And then you will
still not be a "big gun". With mode L/S antennas like that you would
have armchair signals, or at least that is what is predicted.

>>Phase 3D can easily be worked with a couple of small helices attached
>>to an appartment building balcony. With LEO sats this is inpractical
>>because you need to see most of the sky not to cut back on the already
>>short pass times.

>Omni can work well on LEO's at lower frq's.

What I mean is that when you have only 180deg coverage because you are
on a balcony (supposedly shielded to one side) you will cut back the
LEO passes even more. With Phase 3D the satellite will still be viewable
for hours.

>I'l definately try it if the bird ever comes back to life.

Luckily, it has. Time to get up those L/S stations...
(of course it it is a bit premature to assume we have lost both the
2m and 70cm transmitters, but for now it seems both don't work)

I waited for a month on the edge of my seat to see Gee Dub finally take the White House from Big Al, Beijing's pal. It was worth the wait. I'll wait just the same for AO-40 to get past its troubles--or not. All the little voices squeaking in the night about what a terrible idea this was...I have to wonder where they were while the risk-takers and visionaries were designing, building, and negotiating for years with Ariane Space to get this bird into orbit. Oh yeah, they paid their AMSAT dues, so they're *entitled*. Har!!

Whether it works or not, the endeavor is and was worth it. Nothing good comes without hard work, pain, and ultimately having to endure the criticism of the uninvolved, unenlightened, and insolable masses that sit as sheep on the sidelines waiting for someone to feed them what they want...

There's gotta be more to it than "I paid my fee, I want my Phase 3D." Waaahhhh!

AMSAT, thanks for staying in the fight. See ya on the birds.

Humbly yours

We heard ISS on 146.625, one side of a russian
conversation on a constant carrier. A big thrill for
our first time! Picked it up at 12:56 CT on a pass
that took ISS almost overhead. Booming signal
on a 1/4 wave vertical for much of the pass.

What is the traffic on 146.625?

Is there traffic on 145.80?

Thanks, Jim

SB SAT @ AMSAT $ANS-361.01
AMSAT SPECIAL BULLETIN

AMSAT NEWS SERVICE BULLETIN 361.01 FROM AMSAT HQ
SILVER SPRING, MD, DECEMBER 26, 2000
TO ALL RADIO AMATEURS
BID: $ANS-361.01

ANS is pleased to confirm that AO-40 is transmitting on 2401.305 MHz.

Prior to this confirmation, the satellite had not transmitted any signals since December 13, 2000, which was shortly after the first burn of the 400-N motor.

Peter, DB2OS, provided ANS with the following information:

On December 25, 2000 at 21:45 UTC command station ZL1AOX transmitted a L-band reset command which included an initialization block to switch 'on' one of the two S-band transmitters onboard AO-40. Just after the first attempt, AO-40's S-2 beacon was received by Ian, ZL1AOX, on 2401.305 MHz. The signal strength was S-5 to S-6, which compares to S-2 when the beacon was last heard last during testing in early December.

AO-40's S-band transmitter produced a steady signal at ZL1AOX and from the doppler wobbling it was also clear that it was in fact coming from AO-40.

ZL1AOX reported that he was able to copy and observe the S-2 beacon until LOS at 03:45:15 UTC. Predicted LOS from NORAD's orbital set #12 indicated a LOS within 5 seconds of that time.

At the time of reception, AO-40's approximate distance from ZL1AOX was 61,470 kilometers.

Later today (December 26th), ZL1AOX will re-acquire AO-40 shortly after perigee with a reasonably good squint angle. He will than start reloading AO-40's IPS software. Until that task is completed, AO-40's beacon will not carry any telemetry, just carrier.

Stay tuned to ANS for additional bulletins from AMSAT, the official source for information on AMSAT OSCAR-40.

[ANS thanks AMSAT-DL and AMSAT-NA for this information]

Source record: 7139

I'm glad to see AO40 may be working. I would not want to see yet another launch go into the crapper. That still does not change my opinion on building large, complex sats, that take years and years to build and launch. I would rather see less comlex and lower cost sats built and launched more frequently. Seems more in-line with what amateur radio is all about.

Cheers,

Duffy

143.625 you mean. It is the Russian crew talking to their ground station.
When you hear it over the US, they do so via a number of relay stations
on US territory.

>The problem with microwaves in LEO sats is the huge doppler change rate,
>and the usually narrow beamwidths of microwave antennas.

For Rx doppler compensation, you could use a similar mid-transponder beacon that AO-40 uses and have a simple separate PSK receiver at a fixed frequency (say 146.0 MHz) and use the discriminator DC error voltage to control the AFC voltage to the microwave down converter. Thus, the mid-transponder beacon IF output from the microwave down converter would fall to this fixed frequency PSK receiver and any QSO would remain at a fixed IF frequency regardless of doppler e.g. in the 2 m band.

Thus, a voltage controlled DRO would be sufficient as the LO in the microwave down converter and there would not be a need for crystal oscillator multiplier chains or PLL dividers working high in the microwave band.

The Rx converter AFC voltage could even be used to drive the Tx converter LO frequency through a suitable attenuator/amplifier, assuming similar AFC characteristics.

While the shuttle might reach the same altitude as the AO-40 perigee,
the problem is that due to the large eccentricity, at perigee the
AO-40 will have a speed several km/s larger than the shuttle, so there
is absolutely no way the shuttle could catch it.

Anyone thought of mode T/S or H/S? These might be quite interesting even if all the V and U functionality is gone from AO-40. A mode S helix and downconverter solve the downlink side and a 100W 21 or 24Mhz TX with a dipole or vertical should cope on the uplink (I have not done the path loss calcs for the uplink though - any comment from the gurus?)

I figure we'll take what we can get, modewise. What I
wonder now, is weather they'll still be able to steer the high
gain antennas towards the earth.

{from the www.amsat-dl.org website today}

IPS up & running, updated Keps

DB2OS: ZL1AOX successfully
uploaded IPS and we have now first telemetry. We are currently
investigating the telemetry to determine the status and healthy
of the spacecraft. The spacecraft will only transmit on S-Band
and we will not switch TX configuration to V-Band until we have
a better knowledge of the s/c status.

DJ4ZC: A first (quick) look has revealed that
some temperature sensors and possibly some current sensors have
been lost by whatever incident caused the telemetry transmissions
to stop. However, the power situation, in particular the battery
voltages, look nominal.
ï¿½ï¿½ï¿½We will now start a detailed analysis of the
situation; the command stations will continue to follow a conservative
philosophy with the primary target of not causing any additional
damage along with retaining as much evidence as possible for the
analysis of the incident.
ï¿½ï¿½ï¿½Furthermore, command stations will now try to
uplink the entire operational software package, which in particular
should establish positive control over the power generation system.
From there on, the communications capabilities of the spacecraft
will be explored. The 2-meter transmitter is considered off limits
for the time being (in case that it may have been damaged and
thus might have the potential to cause the IHU to crash). The
risk is too large before the WARTE-ORBITS and COMMAND-ASSIST programs
have been updated to reflect the actual capabilities of the satellite
available after the incident.
ï¿½ï¿½ï¿½During the next few days we hope to learn to
what extent the satellite was damaged and to what extent this
will impact mission targets. When we have further analysis, we
will report again.
ï¿½ï¿½ï¿½73's, Karl, DJ4ZC

3568. Which satellite tracking program?

Newsgroup: rec.radio.amateur.space
Date: 2000-12-27 21:51:16 UTC
From: jflanders2@home.com
Message-ID: <3a4a61bf.102590770@news>

I need a satellite tracking program that can control my KCT rotator control board and also make doppler corrections for my FT-847, preferably through the FT-847's CAT interface.

I am evaluating Nova For Windows now, and it is a _very_ nice tracking/control program, but after chasing my tuning knobs during a couple QSOs, I think I would like to try automatic doppler correction.

Recommendations? I would like to try before I buy.

Question - how well do these doppler correction programs work, anyway? I would think the correction required when I am "ahead" of the sat and working someone "behind" it are completely different from what is required when he is "behind" and I am "ahead", right? Can a doppler correction algorithm cope with this?

Jerry W4UK

I think that is a complicated solution when compared to the use of
a computer and tuning interface to the transceiver... And it only
solves the problem for receive, not for the transmit side.

I doubt that you can get it within acceptable accuracy for SSB this
way (say 100Hz). The computer solution is complicated but easily
reproducible.

Nova is probably the best but...

InstantTrack was just updated on Amsat to 1.5
(Y2K) and there is a program called InstantTune that
controls the 847. As I recall you need a null modem
serial cable between the radio and the computer.

You just have to keep the receive band on the main
vfo and turn the track/rev track off.

Works great.

Yes, we have to hope the damage really is to the sensors only, and not
that 1/6 or more of the spacecraft has been lost in a fire or so.
When the magnetorquers don't work anymore, the sat is effectively lost
for any reasonable performing transponder operation. It would not be
possible to stabilize it or to do another burn to change the orbit.

Actually I was a bit surprised that the "first things to do" did not
include to spin down the sat and rotate it by 90 degrees, so that the
attitude is more like we know from AO-10 and 13 (bottom pointed to the
earth at apogee). Apparently the control stations have good equipment
and they can copy the telemetry, something most people seem to have
trouble with.

"The Station" is very good. I've only just started using it in
the last few days and I like it. It will control the FT-847,
and I think your KCT as well (although I don't have one here).

You can download it from the AMSAT web site. It's now free,
and there's a program on the AMSAT site you can use to generate
a registration code.

Maybe you didn't look properly.

I just checked some obvious sites, and the news is here (and
probably on all kinds of other websites):

http://www.rac.ca

http://www.arrl.org

http://www.amsat.org

While this thread started with a post from someone who seemed to
be glad that there was a problem, I don't quite see why
a couple of people would say there has been a response without
there being some basis. The logical step then is to do some
looking around to see what the official websites are saying.

While I can think of plenty of times when groups have failed
because they didn't do things properly, the only way I can see
a satellite being perfectly non-risky is by not launching it.
Kind of defeats it's purpose. It would be a horrible thing if
this satellite doesn't work, after all the time and money put
into it, but even if it never worked it would hardly be a failure.

Was it Oscar 3 or 4 that ended up in a bad orbit, so it didn't
work out as intended? And then there was another Amsat sometime
in the past fifteen years, where a really large antenna had to
be used to make intital contact, because of some desensing problem.

But the first amateur radio satellite, and I thought the first amateur
satellite by any group, went up in late 1961. That was only four
years after Sputnik, the first satellite, went up. Don Stoner makes
a passing comment in CQ, wondering if anyone has any space in a rocket,
and soon someone had arranged space, and there was a satellite to launch.
Oscar One was a "completely useless" thing, with a life of a few weeks
at the most, and all it could do was send out "hi" in morse code;

I think some telemtry was sent by the method of controlling the speed of the code. What use was that? Nothing in the immediate, but terribly useful in proving that amateurs could build a satellite and empty space could be used to launch it, and then all the learning done to make it happen and track it.

While I would think some other group would have come up with the idea eventually, amateur radio was the first to hitch-hike into space. The whole concept has helped countries get into space who otherwise would not be able to afford the expense of big satellites.

The following Oscars weren't all that useful either. I don't iknow which one was the first one with a translator, but those early ones did not have a very long life, and there was that one that landed in a screwy orbit that made it's use problematic.

All that was before my time.

But I can remember when Oscar 6 went up in the fall of 1972. This was going to be the big one, more extensive than the previous ones and having a longer life. I forget exactly how long it actually lasted, but it kept going longer than they had said it would when launched.

Next year it will mark the fortieth year of amateur radio in space. Just like amateur radio is synonymous with radio, since the hobby dates back to the beginning of radio, amateur radio has practically been in space since the first satellite.

Each time an amateur satellite has been launched, it has served some purpose to extend the art. Our satellites may lag behind commercial satellites, but considering the budget considerations, we do pretty well. Those "crummy little satellites" from thirty to forty years ago may not seem all that spectacular now, but at the time they sure were, and there existence has helped lay the groundwork for the satellites that followed. People wouldn't have amateur satellites today that have lifespan in years, if those limited life satellites hadn't gone up, and any failures that have occurred over the years have helped make the next satellite better.

This latest one is number forty. There have been so many amateur satellites in these forty years that I can't keep track of them all. There must have been failures, and I thought the USSR launched some amateur satellites that used a different numbering scheme, so the count may be higher than forty.

That is an amazing accomplishment.

If this latest one doesn't work, it will be sad. But it is nothing to gloat about. And in truth, there will be future amateur satellites, and they will benefit from the launch of this latest one, whether or not it works.

Instead of trashing amateur satellites, we should be considering how few, if any, satellites are up there other than government, military and commercial. Yet there are such things as amateur radio satellites.

The real puzzle here is why we don't read about the launches in the papers, because even forty years after the first amateur satellite, another one is still a major accomplishment.

Michael VE2BVW

I highly recommend LogSat Pro. I have used it for 6 years now (with upgrades) and it is the best of all I have tried. I have tried Nova, InstaTrak and several others that are not defunct. You can find it at www.logsat.com. The author is great to work with and has always welcomed input from his users. Good Luck!

Look on amsat.org

They issued a hard reset and telemetry is running on S-band so far.
They have to upload all the operational software now.

It certainly won't help anyone if AO40 fails, but it's easy to
undervalue accessible LEOs like the RS series and the UoSats. I agree
with what's just been written--plus I'd rather see more magnetometers
and CCDs (perhaps pointing outward!) than yet more store-and-forward
messaging systems.

I still haven't seen any multiband "satellite" transceiver with a built in satellite tracking program :-). Since some satellite tracking programs run very nicely on a 286 PC without a floating point processor, so any decent embedded 16 bit processor in the transceiver should be able to calculate the orbit within the transceiver.

However, there are several disadvantages relying on the calculated orbit. First of all, the keplerian elements must be accurate to a few seconds for a LEO bird, which means frequent element updates and element distribution to all stations. The time at each station must be correct within a few seconds and the location of the receiving station should be accurately known (just observe how hard it is for many hams to get their locator correctly from the map :-).

A GPS receiver would solve the location and time problem, but that would be an overkill.

The LEO AmSat could constantly transmit the satellite location and speed and acceleration vectors (derived from an onboard GPS receiver), thus the receiving station could predict the location of the satellite accurately. This would solve the element distribution and accuracy problem as well as the timing problem, but not the ground station location problem.

However, directly measuring the received doppler error from the mid band beacon solves all those accuracy problems as well as compensates for the satellite transverter frequency drift.

>reproducible.

With a 1 kHz/V tuning sensitivity for 145 MHz and 3 kHz/V for 435 MHz and 9 kHz/V that would not be too hard, if a linear tuning range can be implemented.

Anyway, if a common VCXO (say 100 MHz) is used to drive both the U-band Rx (500 MHz LO) and the L-band Tx converter (1500 MHz LO) with extra multiplier stages for the higher bands, there would be a nearly perfect tracking. Unfortunately, the IFs would be "nonstandard" (65 MHz Rx and 230 MHz Tx).

Yes, that is indeed strange. I would expect the same thing from an
electronic rotator control box. Just upload the keps via an RS232
interface... it could be an extra mode in addition to what is available
now.

But, it seems like only very recently the hamradio manufacturers have
started to realise that the computer control interface they offer is
seriously lacking. I have several older boxes that have "CAT" or "CI-V"
but that do not allow the control of all features present on the front
panel. And in every case the documentation is poor and incomplete.

It should be possible to use a GPS receiver once for location, and in
fact a "QTH locator" should be accurate enough. Leaves only the problem
of knowing the location. Time can be set from a time standard receiver,
or the Internet.
GPS receivers are getting cheaper and smaller all the time, I expect
that they will soon be integrated into handhelds. But of course it
would be an additional item for most existing stations.

How about some long-range dreaming: At least seven private corporations are planning on sending packages to the moon (CNN news item). Just think if we could have them include some amateur gear with their launches. What obstacles would have to be overcome in order to have equipment that would work in the lunar environment?

If each of us kicked in ten bucks, would the nearly $7M generated be enough to fund such a project?

Actually, there was a plan for doing this back in the sixties.

It was called Project Moonray, and the idea was to include an
amateur translator on one of the last trips to the moon.

I remember reading at least one article about the project in CQ, it
must have been in 1968 or 69 though I first read the article a
few years after the fact. I just did a quick search through my
old magazines, and can't find the article.

I was never sure how much of it was dreaming, and how much of it
was real. From memory of the article, they had worked out the details,
and it was do-able.

I just did a websearch, and there is a bit about the project here:
http://www.nitehawk.com/rasmit/nick.html

Among other things, it says the project was intended to go up with
Apollo 18, but the Apollo Project was cancelled before we got to
that number.

The websearch also turned up some hits a few years old indicating
there were plans to revive the project.

Someone with QST on CDROM might check the annual index from '68 and '69
to see if there's mention of Project Moonray. I did check my QSTs,
but not only are they not all in the same place or neatly ordered, but
I didn't bother checking the VHF column.

Now that AO-40 looks to be back in business, (or at least on it's way), can somebody clear up a few things for me?

First, I've seen several references here that suggest that the sat. is not stable. The suggestion is that it's wobbling or tumbling. If so, what effect will that have on future orbital corrections? I'm guessing there is some sort of stabilization system on board, isn't there?

Second, a fellow local ham has heard that there were problems with the orbit change. What he heard was that the sat. will end up in a much higher and eccentric orbit than planned. True/False?

What's the word on all this? I've tried to read the amsat website, but can't make heads or tails of the officalspeak. (Officialspeak: language and phrasing used by bureaucrats and/or government officials to deliberately obfuscate* otherwise simple statements.)

there has been a comment that it is spinning or tumbling, and the burn
went a few minutes into overtime and the satellite ended up at 60,000
miles instead of 50,000 miles, but this was not thought to be a major
problem. The photon cannon hit from the Klingon target practice is the
real difficulty.

Hello
I am just Joe ham. But seems to me we had some big solar flares and storms right around the time of the system crash. I tried to look up the data and found this site for the 13th Dec 2000. Can any one give me the bottom line. I'm having a little trouble interpreting it. It just tickled my brain. I was wondering if the Sun smoked our Christmas bird. (sic)
here is the link to the data:

I think it is only off because the orbit and frequency collides with
another sat. I presume it will be turned on when that problem disappears.

Yes that was the reason they turned it off in was it november?
It was supposed to come back on in the middle of december ,
but it didn't and I heard it was because of a malfunction...
The frequency collision is long gone by now...

Not at all: NOAA-12's APT transmitter was turned off for a
while because it was interfering with NOAA-15. This had
nothing to do with NOAA-16. It hadn't even been launched yet.

The status of all NOAA weather satellites is available at
<http://psbsgi1.nesdis.noaa.gov:8080/EBB/ml/nic14.html>

There you will find that NOAA-16 is still undergoing initial
checkout (so there is no guarantee of *any* downlink), and
that the APT transmitter was shut down in November due to an
anomaly that the engineers are trying to figure out.

Receiving HRPT is non-trivial, but it remains on my to do
list...

I said "There is nothing attractive about having equipment on the moon.".
That does not state anything about orbiting satellites, those are a
completely different animal.

People suggesting it would be neat to have something on the moon usuallY
(always?) have not realized the problems associated with getting something
there, keeping it working, and then doing something useful with it.

You can have a repeater on the bottom of the atlantic. But that does not
mean it is an attractive thing to have.

Well, there yah go :)
NOAA 16 was launched at the time I was talking about, but someone must
have mixed up
the reason its APT was turned off and mistaken it for NOAA12 and it's
frequency collision.
At last a straight answer, thanks :)

Rob Janssen <nomail@rob.knoware.nl> wrote:
>There is nothing attractive about having equipment on the moon.

One attraction is that the moon is visible for a minimum of 20 days
per month; amateur gear up there could provide consistant communications
for 2/3 of each month (or until the batteries ran down during the
periods when the moon is in the Earth's shadow).

>(this has been beaten to death before, try checking some archive services)

Maybe so, but now we have at least seven private corporations that
are showing an interest in sending packages to the moon; we've never
had that before -- that solves a huge logistics problem.

Yes. It wouldn't work, it's been done to death, and those
who think it would be a neat idea need to do their homework.

G3RUH (who else? :-) discusses some of the issues. Look
for article 110 at www.amsat.org

I also wonder where people propose to find lunar launch
opportunities...last one I remember was Apollo 17. That
was a while ago.

We can do far better with satellites in geostationary
transfer orbit. Launch opportunities are available,
and if you can live with GTO you don't need propulsion,
an important saving (mass, money *and* complexity).

No, the idea isn't mine. Look at the 2000 AMSAT-NA
Symposium Proceedings.

3613. Question: Vertical noise lines on NOAA APT image

Newsgroup: rec.radio.amateur.space
Date: 2000-12-30 00:55:05 UTC
From: Pervert_Extraordinaire <valued_customer1@att.com>
Message-ID: <3A4D326E.6C500A90@att.com>
Source record: 7097

[Followup set to rec.radio.amateur.antenna]

Hello,

I've been receiving weather sat images for several weeks.
I've progressed from an unmodified Radio Shack 2006 scanner
with a Discone antenna, to a Hamtronix R139 receiver with a
home-brew QFH antenna. My image quality has improved as I've
modified/upgraded the hardware. However, I'm at a loss how
to improve further.

My present setup:

Receiver:
-Hamtronix R139 Weather Sat Receiver
http://www.hamtronics.com/

Antenna:
-Home-brew QFH antenna, located at ground level
-50' interconnect, RG-213U coax, soldered PL259 and BNC
-antenna made with RG-58 coax per the following.
http://www.rig.org.uk/Members/Software/body_software.html

Demodulator:
-Dell 600Mhz, Turtle Beach Montego II A3D 320 sound card
-SatMon
http://www.satsignal.net/

I am getting vertical noise lines across the image. It appears
to be 60Hz related as there are 30 lines across one of the .250sec
NOAA horizontal scans. (120Hz) I've located the receiver ~10 feet away
from my PC, I've located the antenna as far away from the PC as possible,
I've tried disconnecting the power supplys for the speakers
and printers. I've turned off the monitor. I've moved the feed cables around
(with respect to my PC and PC power lines) but note little noise improvement.

I had the QFH located in the attic at one time. However it was connected
with RG-58 and had similar noise problems. I'm quite sure it I re-install
it (even with my improved RG-213U coax) I'd see the same noise.

I note the noise does decreases slightly as the bird overflys. This leads me
to believe the noise is entering on the antenna rather than my demodulated
(and screened) audio feed.

I do have a cell tower located 1/4 mile from me.

This appears to be my last major hurdle before obtaining quality images.

Any help would be greatly appreciated!!

This is a link to an example file.

(rec.radio.amateur.space added to newsgroups - this
is exactly the sort of thing the newsgroup talks about)

You should hear the buzz on the downlink. I had a bad
power line insulator a while ago that even clobbered
NOAA-16's deafening roar. You may have something similar.

Remember all those ham fox hunts and similar activities?
Now it's time to put those skills to use to find where the
noise is coming from. I got some really weird looks but
found the offending power pole in about 10 minutes...

Did you see the "wavy-ness" of the noise? I've been told
a 60Hz noise should be more fixed in period. Now I'm wondering
if it's something else?

> Remember all those ham fox hunts and similar activities?
> Now it's time to put those skills to use to find where the
> noise is coming from. I got some really weird looks but
> found the offending power pole in about 10 minutes...

Any suggestions on how to attack this. How does one
identify a bad insulator? Look for carbon tracks. ;-)

Thanks for the response!

Well I don't agree with you at all Rob. BTW, sorry to sound so harsh in the
first post there and thanks for not escalating the flames. In my opinion having
a repeater on the moon is no more inaccessible than having a repeater in orbit,

both are pretty well 'on their own' so to speak.

Hell, guys even bounce signals off the moon so why not use a repeater?...think of the prestige!...think of the fun of seeing how little power you can use to 'chunk' it!...gee...when it IDs in Morse you tell your neighbour that he's listening to "a ham radio transmitter on the moon"...instant big impression!...where's your 'experiment quotient'?.

When 'man first set foot on the moon' I took my two boys and two girls outside that night and pointed out the bright moon and told them that there was two men walking around on the surface there 'Right Now'...they remember it to this day! (at least the boys do!) and they were around 4 or 5 then!.

Your astronomy is incorrect. The moon keeps the same side toward earth at all times, plus or minus a few degrees, so your proposed rig would be workable at some time of day every day of the month, assuming that your proposed frequency isn't swamped by the sun on those few days each month that the moon is near the sun in the sky. However, it would be in total darkness for approximately two weeks each month.

Yes, we all learned that in elementary school science. That doesn't
change the fact that the moon is *visible* for a minumum of 20 days
per month. The remaining time the equipment would be in the shadow
of the earth and the batteries wouldn't be charging.

Jim Shaffer, Jr. <jshaffer@mail.csrlink.net> wrote:

>Your astronomy is incorrect.

No it's not. Because there is no difference in the periods of rotation and revolution, the same side of the moon is always turned toward the earth. However, about 59% of the moon's surface has been seen from earth, due to libration: Libration in latitude occurs because the axis of rotation is tilted about 6.5 degrees WRT the axis of revolution. Libration in longitude occurs because the speed of revolution varies in accordance with Kepler's second law, while the rotational speed is essentially constant. Diurnal libration occurs because the changing position of the observer relative to the moon, due to rotation of the earth. Physical libration is a small pendulum-like rotational oscillation of the moon with respect to its radius vector.

This certainly shows you have not informed yourself before.
Read up on the situation, the problems, and the usefulness of the result in
one of the many posts that have been made before, or the G3RUH article.

Many amateurs may be prepared to donate money to get a useful satellite
to do every-day experiments. Few will be prepared to donate money to
compete with the government or private corporations about "prestige".

The Lunakhod rower would have been a much better platform, since it was pressurised, thus, greatly simplifying heat dissipation problems. It also contained a radioisotope generator to keep the systems warm (but inoperational) during the lunar night. But this was a long time ago.

Anyway,the lunar surface would be the most stupid place to put an amateur repeater due to delta-v, power and link budget reasons.

>We can do far better with satellites in geostationary
>transfer orbit. Launch opportunities are available,
>and if you can live with GTO you don't need propulsion,
>an important saving (mass, money *and* complexity).

The GTO is a usable compromise as long as we can not deploy several geosynchronous satellites. While the geosynchronous orbit is not stable, thus requiring some station keeping fuel, there is not a need to maintain the position as accurately as TV satellites (due to the smaller bandwidth requirements of amateur transmissions and hence no need for very narrow antenna beams), thus much less station keeping fuel is required.

> frequency collision.
> At last a straight answer, thanks :)

Here are the facts.

NOAA 16'S APT tx is faulty. The satellite continues to transmitt using HRPT.
Ground control noticed higher than normal current with no or weak signal.
They have tried several times to switch on the TX with no success.
NOAA 15 has been switched off due to close proximity with NOAA 12.
NOAA 12 & 14 continue to give good APT signals.

I hope this helps.

Regards

The International Space Station contact with the Armstrong Fundamental School in Hampton, VA, USA will be during the first week of January. Barring unforeseen circumstances their contact will be one of 2001-01-04 starting at 13:38 UTC or 2001-01-05 starting at 20:34 UTC. I'll try to keep the page at http://ariss.gsfc.nasa.gov/ up to date with any changes. The downlink will be on 145.80 and should be easily audible over the East coast of North America. Real-time coverage of the audio is expected via the Internet.

The wobbling, tumbling, it's actually Spinning.
Spin Stabilization is used on satellites. Spinning like a gyro gives it stability and thermal control. Since one side does not always face the Hot Sun or Cold deep space. AO-40 however will not always spin, once it's in the final orbital position it will be de Spun and deploy the Solar Panels and High Gain antenna's.
There is a unique thermal management systems onboard that will handle keeping the birds temperature under control and 3-axis stability to keep the antennas pointed at the earth as it orbits.

There was a problem with the first Orbital positioning burn it ran a little long than planed. It did place the bird in a higher orbit than planed for at this time, however there are several more burns of the large 400N motor needed to get to the final orbital position.

This satellite is one of the Most complex satellites ever placed in orbit by anybody and it takes time to get the bird into position and operational. The task before the controllers is monumental and having the Ham Radio community looking over you shoulder offering half brained suggestions as to what to do to fix some perceived problem does not make their job easier.

There will be a lot of rumors going around about the health of the bird being given by people that simply don't know. The only good source of information is the AMSAT news service, subscribe to that e-mail list at www.amsat.org.

Do you have any reliable information that it has intentionally been put into a spinning mode ? The story I have heard is that it is really tumbling, which would suggest an unintentional ejection of propellant.

The extra apogee height is not a problem, since the intention has been to increase the orbital inclination from 6 degrees to 63 degrees, a high apogee will minimise the propellant consumption.

>This satellite is one of the Most complex satellites ever placed in

This may be the most complicated amateur satellite manoeuvre, but the most complex communication satellite manoeuvre was about a year ago, when the satellite ended into a useless orbit due to a booster failure. The satellite was flown around the moon to get into a usable orbit.

Where did you read about the tumbling?

On "official" sites I read only that the spin rate as measured by watching the downlink signal is about twice as high as correct/expected, and that the spin rate as indicated by the telemetry is what would be expected.

Assuming the minimal set of unexplainable facts, I would assume the measurement of spin rate from the downlink signal is incorrect.
But apparently the control stations, who know much more about this, assume that both the spin rate is unexplainably high and the telemetry indication for it is somehow defective.

When the spin rate indeed is very high, it of course remains to be explained why that is... the helium pressure is measured to be normal, but maybe the propellant or oxydizer could have escaped from the tanks without helium pressurization?

I have always wondered how the motor valves can be open for an unintentionally long time, but still close at the same moment for propellant and oxydizer. When the valves are sticky, one would not assume that... But maybe these are some kind of "tandem" valves that always open and close at the same time?

Could it be that the spin rate is high because the computer has been left in a crashed state so long, and the magnetorquers have spun it up? The latest reports before the burn said that the attitute relative to the magnetic field was such that spin up was easy. However, I expect that the magnetorquer operation needs some really coherent software operation, not simply sending some rubbish to an output port one time.

Although ANS has released a couple of news bulletins lately, it seems like
they think that the best way of avoiding the spread of incorrect or not
yet completely verified information is to keep absolutely silent.

Of course this does not work very well in the real world... they will
not be the source of incorrect information, but it will spread even
faster still, because everyone will start speculating.

Fortunately there are some sites that provide somewhat more frequently
updated status information, like www.amsat-dl.org and www.amsat-uk.org

Hi all

i am thinking about using my computer to control my antennas

i have got a DCE az rotator & a yaesu g400 el rotator the dce could do with being replaced in the next 12months due to ware (bit sloppy in the wind) i have beren trying to look for a yaesu gs-232 controller but i can not find any info on the net or does anyone have any othe ideas

cheers matt

With all the acronyms these days it's impossible to keep up on all of them. ISS sounds like a new mode (SSB GTOR AMTOR RTTY HSMS "ISS"). Why can't people just say "International Space Station"?

Perhaps for the same reason you typed "SSB GTOR AMTOR RTTY HSMS" and not
single side band, etc.

Just a thought......if the satellite has some "wobble", it's spin rate would appear to be much higher as the narrowbeam S-band antenna would seem to peak and null to a ground station much faster than the actual spin rate. Wonder if they've looked into that?

Go to the amsat.org page and look under the files section. There is a program called fodtrack. It is a very simple tracking program that has a simple interface that works off the parallel port. In the program is a schematic for the interface. They were offering the interface for sell already built if you want it. I bought one from them several years ago and it works fine with the Yeasu AZ/EL rotators. Should work with any rotator that has a pot that tells the antenna position and relays for the direction. If not it should be able to modify the circuit to do so.

As the tracking program is just a basic get the job done program , I usually run a graphics tracking program in another window under windows 98.

There was a very interesting point raised by G3RWL at Amsat UK during one of the updates a couple of days ago.

"I'm not sure how *anything* could have leaked without affecting the helium pressure"

I include a snip from one of the Updates from Peter DB20S:

<A quick look at the LIU instrumentation showed that the Helium high pressure was essentially where we left it after the first <400N motor burn (173 bar).

I would have though this would be a good indicator that nothing is leaking.

Just a thought.

Best Wishes for the New year

Use a handheld scanner tunned to an unused spot in the VHF civil air band
(108-138) to "track down" noise sources. Remember the air band is AM and you
should be able to hear the noise fairly clear. To verify a power pole has a
bad insulator (or wire junction), use a 3Lb{1Kg} (or so) hammer to tap,
(DO NOT SLAM the pole!) a little tap will do. You should be able to hear the
noise change when the pole is taped.
Good luck and expect some very strange looks!

Will the scanner allow me to narrow down the potential poles? In other words,
will the noise change volume as I approach the offending pole? Or must I
hammer on all poles within a mile of my house? ;-)

> Good luck and expect some very strange looks!

Yea.... I'd expect quite a few.
Hope I don't see a group of people in white coats approaching. ;-)
